

Swing Clamps with Sturdy Swing Mechanism

Top flange type, with optional position monitoring, double acting, max. operating pressure 350 bar

Application

Hydraulic swing clamps are used for clamping of workpieces, when it is essential to keep the clamping area free of straps and clamping components for unrestricted workpiece loading and unloading.

Due to the sturdy swing mechanism and the manifold possibilities of position monitoring these swing clamps are particularly suited for

- Automatic manufacturing systems
- Clamping fixtures with workpiece loading via handling systems
- Transfer lines
- Test systems for motors, gears and axes
- Assembly lines
- Special machine tools

Description

The hydraulic swing clamp is a pull-type cylinder where a part of the total stroke is used to swing the piston.

The favourable area ratio (piston/piston rod) allows high clamping forces already at relatively low oil pressures.

Due to the sturdy swing mechanism the angle position of the clamping arm remains the same after a slight collision with the workpiece during loading or unloading. Also a collision during the clamping process is not critical.

When using high flow rates the swing speed is limited by installed throttle points.

For connection via drilled channels, adjustable throttle valves can be screwed instead of the screw plugs.

The FKM wiper at the piston rod can be protected against coarse and hot swarf by an optionally available metallic wiper (see page 6).

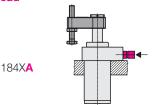

The different possibilities of the position monitoring are presented at the side.

Important notes see page 6.

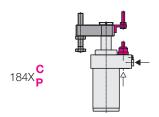

Advantages

- 5 sizes available
- Compact design partially recessible
- High clamping force at low pressures
- Sturdy swing mechanism
- Insensitive against high flow rates
- Indexing of the clamping arm in a specified position is possible
- Special swing angle easily realisable
- Standard FKM wiper
- Metallic wiper optional
- Throttle valves available as accessory
- Screw counterbores coverable
- position monitoring available in six variants
- Hydraulic and pneumatic ports integrated in the flange
- Mounting position: any

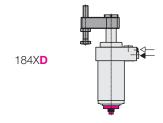

Installation and connecting possibilities Pipe thread

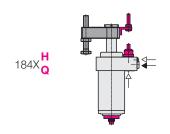

Pneumatic position monitoring integrated Monitoring of the clamping arm in clamping position (adjustable)

Monitoring of the piston in unclamping position

Both controls combined

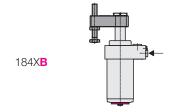

Indexing Metallic wiper for coarse and hot swarf optional Accessory Throttle valve (see page 4)

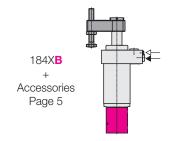

Drilled channels

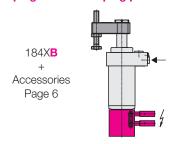

Position monitoring as accessories Switch rod for external sensors

Pneumatic position monitoring in clamping and unclamping position

Electrical position monitoring in clamping and unclamping position

Versions: Code letters A, B, C, D, H, P, Q **Dimensions • Swing angles**

B (with switch rod)

Screw plug (pneumatic valve for

monitoring can be retrofitted see page 5)

(Monitoring "Clamped")

Switching area 2 ÷ 9 mm

Switching area 2 ÷ 10 mm

A = Clamping

B = Unclamping

E = Unclamped (pneumatic)

S = Clamped (pneumatic)

Clamping position ±1° Swing direction Swing direction Example for swing angle < 90° off-position ±3° wing angle 90° Ø p1 off-position ±3° Indexing mark Ø p2 clamping position Plastic covers see page 4 5 x 45° nax. Ġ at both sides only for 184<u>3</u> Pneumatic port M5 at both sides at 45° only for 1843 B, D and H

Swing angle 1. Swing angle 90° (standard)

Part no. 90° cw 184X X090 RXXD

90° ccw 184X X090 LXXD 0° 184X X000 0XXD

2. Swing angle α < 90°

α = 15° to 75° in gradation of 5°

By insertion of a distance plate the return stroke of the piston is reduced and thus the swing angle is reduced.

Clamping stroke and clamping position remain the same. The swing stroke and the dimensions h, h1, m and x are reduced by y:

 $y = (90^{\circ} - \alpha^{\circ}) * k$ (k see chart page 3)

Example:

1845 A090 L30D Swing clamp

Desired swing angle 45° ccw 1845 A045 L30D Part no.

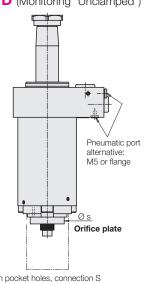

Shortening:

 $y = (90^{\circ} - 45^{\circ}) * 0.12 \text{ mm/}^{\circ} = 5.4 \text{ mm}$

3. Swing angle > 90°

Available on request!

Pneumatic valve (actuated by the clamping arm) Silencer for pneumatic valve Attention danger of collision! The contact bolt for the actuation of the pneumatic valve must be completely screwed into the angle bracket for start up (see page 4 dimension 3.5 mm) The adjustment is made with clamped workpiece to approx. 5 mm D (Monitoring "Unclamped") Pneumatic port alternative: M5 or flange

With pocket holes, connection S can be used for venting

Important note

The lower part of the swing clamp must be protected against swarf and dirt for trouble-free functioning of the orifice plate.

Actual issue see ws.roemheld.com

Code letter X see page 2.

M = Option metallic wiper (see also page 6)

h max. / h1 max. / x max. = upper edge nut

Effective clamping force with accessory clamping arm as a function of the oil pressure

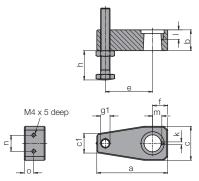

^{*} Clamping force for other lengths see page 4.

Subject to modifications

 $^{^{1)}}$ h / h1 / x = upper edge piston $^{2)}$ m = lower edge clamping arm

Accessories - Clamping arms • Plastic covers • Metallic wipers• Flow control valves Calculation of the flow rate • Calculation of the clamping force

Clamping arm, max. 350 bar

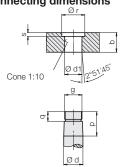

Clamping arm complete with angle

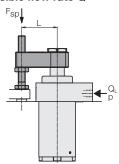

Special clamping arm 1. Connecting dimensions

2. Admissible flow rate Q*

In the chart on page 3, the admissible flow rates for clamping and unclamping with the clamping arms (accessories) are specified.

Longer special clamping arms have a higher torque of inertia. To avoid an overload of the swing mechanism, the flow rate has to be reduced:

2.1 Moments of inertia are known

$$Q_L = Q_e * \sqrt{\frac{J_e}{J_L}} \text{ cm}^3/\text{s}$$

Q_L = Flow rate with special clamping arm

Q_e = Flow rate as per chart (page 3)

J_e = Moment of inertia of the clamping arm (accessory) with contact bolt (chart)

J_L = Moment of inertia special clamping arm determined with the help of the CAD model in the computer

* Only for vertical mounting position!

2.2. Accessory Throttle valve

Throttle valves are used

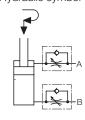

- in order to reduce the swing speed of the clamping arm;
- in order to improve the synchronism of several swing clamps.

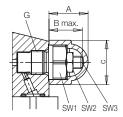

This application is only possible for manifoldmounting connection through drilled channels.

Important note

If throttling is too strong, the back pressure can trigger premature switching of pressure switches and sequence valves.

Special clamping arm

Clamping force and admissible operating pressure

Effective clamping force (general)

$$F_{Sp} = \frac{p}{A + (B * L)} \le F_{adm.}$$
 [kN]

Admissible clamping force

$$F_{adm} = \frac{C}{L}$$
 [kN]

$$\label{eq:padm} \mbox{Admissible operating pressure} \\ p_{\mbox{adm}} \, = \frac{D}{L} \, + \, E \leq 350 \qquad \qquad \mbox{[bar]}$$

L = special length [mm] p = pressure [bar]

A, B, C, D, E = constants as per chart

Constant

| | 1843 | 1844 | 1845 | 1846 | 1847 |
|---|-------|-------|-------|-------|-------|
| Α | 46.64 | 33.15 | 18.98 | 12.72 | 8.93 |
| В | 0.335 | 0.17 | 0.073 | 0.04 | 0.027 |
| С | 210 | 420 | 900 | 1760 | 3000 |
| D | 9795 | 13926 | 17078 | 22386 | 26805 |
| E | 70.26 | 71.33 | 65.44 | 70.36 | 81.78 |

Example: Swing clamps 1843 L = 70 mm

1. Admissible clamping force $\frac{F_{adm}}{=} \frac{C}{L} = \frac{210}{70} = 3 \text{ kN}$

2. Admissible operating pressure $\frac{p_{adm}}{=} \frac{D}{L} + E = \frac{9795}{70} + 70.26 = 210 \text{ bar}$

Accessories for 184XB0XX • Pneumatic position monitoring (not adjustable) Pneumatic valve

Application

A prerequisite for automated processes of workpiece clamping are hydraulic clamping elements whose position can be monitored at any time. The pneumatic position monitorings signal the following conditions by closing two bore holes:

- 1. Piston extended, clamping arm in off-position.
- 2. Piston in clamping area, clamping arm in clamping position.

By the pressure increase in the pneumatic line an electro-pneumatic pressure switch or a differential pressure switch can be actuated.

The electrical switching devices are integrated in the electric control so that on the clamping fixture no electricity is required.

Description

The pneumatic position monitoring consists of the stainless control housing with fit signal sleeve, to be connected to the switch rod of the swing clamp by means of the delivered screw. Four fixing screws are included in our delivery.

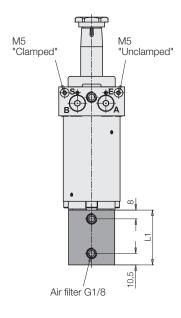

Pneumatic port

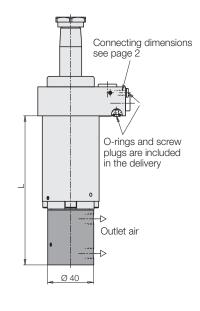

Drilled channels

The swing clamp with the mounted position monitoring is inserted into the location hole and is immediately ready for use with the mounted O-rings.

Hose connection

Remove the plugs M5 and screw-in connecting nipple M5 (accessory) Sealing to the flange area is made by the two O-rings.

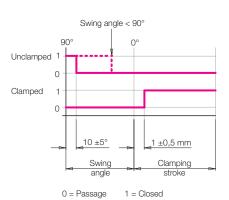

Technical data

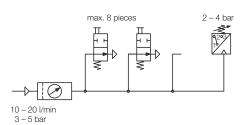

| Port | | O-ring or thread M5 |
|-----------------------------|---------|------------------------|
| Nominal diameter | [mm] | 2 |
| Max. air pressure | [bar] | 10 |
| Range of operating pressure | [bar] | 35 |
| Differential pressure*) at | | |
| 3 bar system pressure | [bar] | min. 1.5 |
| 5 bar system pressure | [bar] | min. 3.5 |
| Air flow rate **) | [l/min] | 1020 |

- *) Required pressure drop if one or several position monitorings are not operated.
- For measuring the air flow rate appropriate devices are available. Please contact us.

Function chart

Monitoring by pneumatic pressure switch

For the evaluation of the pneumatic pressure built-up standard pneumatic pressure switches can be used. It is possible to monitor with one pressure switch up to 8 position monitorings connected in series (see circuit diagram).

It has to be considered that process-safe functioning of pneumatic position monitorings is only guaranteed with throttled air and system pressure. The nominal values are indicated below technical characteristics.

Accessory for 184XB0XX • Electrical position monitoring (adjustable) Important notes • Wiper system • Throttling of flow rate

Application

Electrical position monitorings signal the following conditions due to damping of two inductive proximity switches:

- Piston extended, clamping arm in off-position.
- 2. Piston in clamping area, clamping arm in clamping position.
- Piston in final position, no workpiece inserted. *)
- *) If this function is not desired, e.g. in setting mode, the proximity switch can be adjusted so that the switch is still damped at the stroke end (see function chart).

Description

The electrical position monitoring consists of the housing with two adjustable inductive proximity switches and one switching cam fixed at the switch rod of the swing clamp.

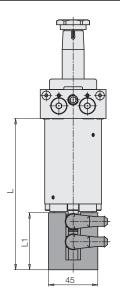

The fixing screws are included in our delivery.

The housing can also be mounted turned by 180°. The radial distance of the proximity.

by 180°. The radial distance of the proximity switches to the switching cam should be 0.5 mm. It is secured by means of a set screw M4. After untightening of the locking screw M4 the proximity switches can be axially displaced.

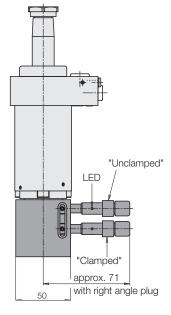

Please note:

Careful design is required. According to the corresponding application conditions, safety measures have to be planned and checked later on. Inductive position monitorings are not suitable for the use in coolant and swarf areas.

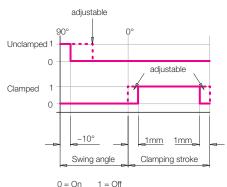

Technical data

| Operating voltage | 1030 VDC |
|----------------------------------|------------------|
| Max. residual ripple | 15 % |
| Max. constant current | 200 mA |
| Switching function | interlock |
| Output | PNP |
| Material of housing | stainless steel |
| Thread | M8x1 |
| Code class | IP 67 |
| Ambient temperature | -25+70 °C |
| LED function display | yes |
| Protected against short circuits | yes |
| Type of connection | right angle plug |
| Length of cable | 5 m |

Important notes

Swing clamps must only be used for clamping of workpieces in industrial applications and may only be operated with hydraulic oil. They can generate very high forces. The workpiece, the fixture or the machine must be in the position to compensate these forces.

In the effective area of piston rod and clamping arm, there is the danger of crushing. The manufacturer of the fixture or the machine is obliged to provide effective protection devices.

The swing clamp has no overload protection device. When mounting the clamping arm, the clamping arm or the hexagon socket in the piston have to be backed up for tightening and untightening the fixing nut. During loading and unloading of the fixture and during clamping a collision with the clamping arm has to be avoided.

Remedy: Mount position adaptor.

Operating conditions, tolerances and other data see data sheet A 0.100.

Wiper system

The standard FKM wiper has a high chemical resistance against most cooling and cutting fluids

The optional metallic wiper protects the FKM wiper against mechanical damage due to big or hot swarf.

It consists of a radially floating wiping disk and a retaining disk.

The metallic wiper can be delivered already mounted ("M") or as an accessory for retrofitting (see page 4).

Attention!

The metallic wiper is not suitable for dry machining or minimum quantity lubrication. Also in applications with very little grinding swarf, the standard FKM wiper has a better protection effect.

If there is any danger that small particles stick to the piston rod, the metallic wiper disk can also be replaced by a hard plastic disk.

Throttling of the flow rate

A flow rate throttling always has to be effected in the supply line to the swing clamp. This avoids a pressure intensification and thereby pressures exceeding 350 bar.
