15 **Abstract.** *Artemisia*, along with Chenopodiaceae is the dominant component growing in the desert and dry  
16 grassland of the Northern Hemisphere. *Artemisia* pollen with its high productivity, wide distribution, and easy  
17 identification, is usually regarded as an eco-indicator for assessing aridity and distinguishing grassland from  
18 desert vegetation in terms of the pollen relative abundance ratio of Chenopodiaceae/*Artemisia* (C/A).  
19 Nevertheless, divergent opinions on the degree of aridity evaluated by *Artemisia* pollen have been circulating  
20 in the palynological community for a long time. To solve the confusion, we first selected 36 species from 9  
21 clades and 3 outgroups of *Artemisia* based on the phylogenetic framework, which attempts to cover the  
22 maximum range of pollen morphological variation. Then, sampling, experiments, photography, and  
23 measurements were taken using standard methods. Here, we present pollen datasets containing 4018 original  
24 pollen photographs, 9360 ~~pollen morphological trait measurements~~~~statistical pollen morphological traits~~,  
25 information on 30858 source plant occurrences, and corresponding environmental factors. Hierarchical cluster  
26 analysis on pollen morphological traits was carried out to subdivide *Artemisia* pollen into three types. When  
27 plotting the three pollen types of *Artemisia* onto the global terrestrial biomes, different pollen types of  
28 *Artemisia* were found to have different habitat ranges. These findings change the traditional concept of  
29 *Artemisia* being restricted to arid and semi-arid environments. The data framework that we designed is open  
30 and expandable for new pollen data of *Artemisia* worldwide. In the future, linking pollen morphology with  
31 habitat via these pollen datasets will create additional knowledge that will increase the resolution of the  
32 ecological environment in the geological past. The *Artemisia* pollen datasets are freely available at Zenodo  
33 (<https://doi.org/10.5281/zenodo.69003086791891>; Lu et al., 2022).

## 34 **1 Introduction**

35 The concept of global change can be considered as any consistent trend in the environment - past, present, or  
36 projected - that affects a substantial part of the globe. Consequently past climates shed light on our future  
37 (Tierney et al., 2020). When attempting to reconstruct past global change prior to meteorological records, we  
38 need some appropriate biological or abiotic proxies based on long-term, consistently collected data, e.g. leaf  
39 wax biomarkers (Bhattacharya et al., 2018), tree-ring data (Moberg et al., 2005), leaf form (Yang et al., 2015),  
40 pollen data (Mosbrugger et al., 2005; Guiot and Cramer, 2016; Marsicek et al., 2018), atmospheric carbon  
41 dioxide (Zachos et al., 2008; Beerling and Royer, 2011), and isotope records (Zachos et al., 2001;  
42 Sánchez-Murillo et al., 2019). Determining a suitable proxy to reconstruct palaeoclimate and  
43 palaeoenvironment is a great scientific challenge (Tierney et al., 2020; McClelland et al., 2021).

44 The pollen of *Artemisia* (A), together with that of Chenopodiaceae (C) in arid and semi-arid areas, in the  
45 form of the ratio of C/A pollen abundance, was applied to distinguish grassland and desert vegetation types  
46 and assess the degree of drought in the geological past (El-Moslimany, 1990; Sun et al., 1994; Davies and Fall,  
47 2001; Herzsuh et al., 2004; Xu et al., 2007; Zhao et al., 2009; Zhang et al., 2010; Zhao et al., 2012; Li et al.,  
48 2017; Ma et al., 2017; Koutsodendris et al., 2019; Wang et al., 2020), because both Chenopodiaceae and  
49 *Artemisia* are dominant elements of desert vegetation (China Vegetation Editorial Committee, 1980; Vrba,  
50 1980; Tarasov et al., 1998; Herzsuh et al., 2004; Li et al., 2010; Zhao et al., 2021), and the sum of their  
51 pollen relative abundances in the surface soil is usually more than 50% in arid and semi-arid areas (Sun et al.,  
52 1994; Lu et al., 2020).

53 Among them, the pollen of *Artemisia*, with its high productivity, wide spatial and temporal distribution,  
54 easy identification, and morphological uniformity under the light microscope (LM), is an essential component  
55 and useful bio-indicator in pollen-based past vegetation reconstructions and environmental assessments. Some  
56 researchers regarded *Artemisia* as an aridity indicator (El-Moslimany, 1990; Yi et al., 2003a; Yi et al., 2003b;  
57 Liu et al., 2006; Cai et al., 2019; Cui et al., 2019; Chen et al., 2020; Wu et al., 2020; Cao et al., 2021), while  
58 others suggested that the correlation between the relative abundance of *Artemisia* pollen and humidity was  
59 insignificant (Weng et al., 1993; Sun et al., 1996; Koutsodendris et al., 2019; Lu et al., 2020; Zhao et al.,  
60 2021). Consequently, there is an urgent need to evaluate whether different pollen types of *Artemisia* represent  
61 distinct habitats.

62 In the past, *Artemisia* pollen was regarded as very uniform under LM (Wodehouse, 1926; Sing and Joshi,  
63 1969; Ling, 1982; Wang et al., 1995). For instance, following the description and statistics of pollen  
64 morphology of 27 species of *Artemisia* in Eurasia under LM, Sing and Joshi (1969) stated that the pollen  
65 grains of *Artemisia* are consistent and continuous in morphology. Later, some authors recognized a series of  
66 pollen types (Chen, 1987; Jiang et al., 2005; Ghahraman et al., 2007; Shan et al., 2007; Hayat et al., 2009;  
67 Hayat et al., 2010; Hussain et al., 2019), based on a detailed survey of the pollen micromorphology of  
68 different taxa under the scanning electron microscope (SEM).

69 For example, Chen (1987) described the pollen morphology of 77 *Artemisia* species from China under  
70 LM and SEM and divided these pollen grains into six types by using pollen characters, such as the shape and  
71 size of the spinules as well as the density of spinules and granules. Type I (sparse spinules with granules  
72 among them), type II (dense spinules, no or few granules), type III (sparse spinules, no granules), type IV  
73 (dense spinules, well-developed granules), type V (small and sparse spinules, smooth tectum) and type VI  
74 (dissimilar spinules with granules among them).

75 Shan et al. (2007) investigated the pollen morphology of 32 *Artemisia* species from the Loess Plateau of  
76 China under LM and SEM and divided these pollen grains into five types according to exine sculpture: type I  
77 (dense spinules with swollen bases, small granules), type II (dense spinules, swollen bases almost united),  
78 type III (dense spinules with swollen bases and smooth tectum), type IV (sparse small spinules and smooth  
79 tectum) and type V (sparse spinules, small granules).

80 Jiang et al. (2005) observed the pollen morphology of 57 representative plants in 7 groups of *Artemisia*  
81 under LM and SEM. This pollen can be divided into two types based on exine sculpture: type I (spinules  
82 multi-ruminated with flared bases, connecting the mostly densely arranged spinules) and type II (densely or  
83 loosely arranged spinules without flared bases, interspace glandular or smooth) with subtypes II-1, II-2, II-3,  
84 and II-4 based on the distribution of the spinules.

85 Ghahraman et al. (2007) studied the pollen morphology of 26 species of the 33 *Artemisia* species in Iran  
86 under LM and SEM. Based on exine ornamentation observed under SEM, two types of pollen grains were  
87 recognized: type I, exine surface covered with dense acute spinules, **and** type II, exine surface with few  
88 spinules.

89 Hayat et al. (2009, 2010) carried out a palynological study of 22 *Artemisia* species from Pakistan under  
90 LM and SEM. Earlier work demonstrated the phylogenetic associations within *Artemisia* based on a  
91 phylogenetic analysis of 9 characters (pollen type, pollen shape, spinule arrangement, exine sculpture, spinule

92 base, the length of polar axis, the length of equatorial axis, exine thickness, and colpus width) of pollen grains  
93 of *Artemisia*. In the latter work, eight micromorphological characters were identified and pooled by cluster  
94 analysis, leading to the recognition of 5 groups.

95 Hussain et al. (2019) studied the pollen morphology of 15 *Artemisia* species in the Gilgit-Baltistan region  
96 of Pakistan utilizing SEM and divided these species into four groups based on cluster analysis of seven  
97 micromorphological characters (pollen type, pollen shape, spinule arrangement, exine sculpture, spinule base,  
98 polar length, and equatorial width).

99 Almost all of the above-mentioned *Artemisia* pollen classifications were designed to solve taxonomic or  
100 phylogenetic problems, and only a few were concerned with linking diverse habitats to the different pollen  
101 types in *Artemisia*.

102 Here we attempt to 1) present abundant pollen photographs of 36 species from 9 branches and 3  
103 outgroups of the genus (ca. 400 species worldwide, see Ling, 1982; Bremer and Humphries, 1993),  
104 constrained by the phylogenetic framework of *Artemisia* (Sanz et al., 2008; Malik et al., 2017); 2) describe  
105 and measure the morphological traits of these pollen grains; 3) provide a new classification of pollen types  
106 and their distribution worldwide, with a key to pollen types in *Artemisia*; 4) explore the diverse ecological  
107 niches of *Artemisia* represented by different pollen types in order to evaluate palaeovegetation and reconstruct  
108 palaeoenvironments.

## 109 **2 Materials and methods**

### 110 **2.1 Sampling strategy**

111 The 36 pollen samples studied were selected from voucher sheets in the PE herbarium at the Institute of  
112 Botany, Chinese Academy of Sciences (Fig. 1, Table B1), covering 9 main clades, i.e., Subg. *Tridentata*, Subg.  
113 *Artemisia* (contains Sect. *Artemisia*, Sect. *Abrotanum* I, Sect. *Abrotanum* II and Sect. *Abrotanum* III), Subg.  
114 *Pacifica*, Subg. *Seriphidium*, Subg. *Absinthium*, and Subg. *Dracunculus*, constrained by the phylogenetic  
115 framework of *Artemisia* (Malik et al., 2017) and 3 outgroups (Sanz et al., 2008), reflecting the maximum  
116 diversity or morphological variation under LM and SEM.

117  
 118 **Figure 1.** Phylogenetic tree of *Artemisia* (modified from Malik et al., 2017). The styles of the strokes that  
 119 were used to draw the branches indicate the traditional subgeneric classification of *Artemisia*, and the yellow  
 120 spots indicate sampled taxa.

121 **2.2 Data acquisition**

122 Pollen samples were acetolyzed by the standard method (Erdtman, 1960) and fixed in glycerine jelly. Standard  
 123 procedures were followed for LM and SEM (Chen, 1987; Wang et al., 1995). The pollen grains were  
 124 photographed under LM (Leica DM 4000) at a magnification of  $\times 1000$  and SEM (Hitachi S-4800) at an  
 125 accelerating voltage of 30 kV. The pollen terminology followed the descriptions of Hesse et al. (2009) and

126 Halbritter et al. (2018). The statistical pollen morphological traits under LM (Figs. 2a-b, P: Polar length; E:  
127 Equatorial width; P/E; T: Exine thickness; L: Pollen length; T/L) of each species were measured using 20  
128 pollen grains. We chose five pollen grains under SEM for each exine ornamentation trait in each species (Figs.  
129 2c-f, D: Diameter of spinule base; H: Spinule height; D/H; Gs: Granule spacing; Ss: Spinule spacing; Gs/Ss;  
130 Ps: Perforation spacing), and on average, randomly selected four regions of each pollen grain for measuring,  
131 yielding a total of 20 measurements. The mean value (M) and standard deviation (SD) of the pollen grains of  
132 each species were measured and calculated in both polar and equatorial views (Appendix A, Table 1).

133

134 **Figure 2.** Graphical illustration of measured pollen morphological traits in *Artemisia* (a-b: *A. annua*; c-d: *A.*  
135 *vulgaris*) and outgroups (e: *Kaschagaria brachanthemoides*; f: *Ajania pallasiana*). Scale bar in LM and SEM  
136 overview 10 µm, in SEM close-up 1 µm.

137 The scientific names of selected taxa were standardized according to Plants of the World Online  
138 (<https://powo.science.kew.org/>). The specimen sampling coordinates of the corresponding taxa were obtained  
139 from the Global Biodiversity Information Facility (GBIF, <https://www.gbif.org/>). Only preserved specimens  
140 were filtered for GBIF data given their well-documented geographical information and the availability of  
141 specimens as definitive vouchers. The distribution data on observations and cultivated collections provided by  
142 GBIF were excluded because they may contain incorrect identification or incorrect geo-referencing (Brummitt  
143 et al., 2020). Next, the distribution data was standardized cleaned using R package "CoordinateCleaner"  
144 (Zizka et al., 2019); no outliers were found.

145 The corresponding environmental factors including altitude and 19 climate parameters of these  
146 coordinates were obtained from WorldClim (<https://www.worldclim.org/>) with a spatial resolution of 30  
147 seconds (~1 km<sup>2</sup>) in 1970-2000 by Extract MultiValues To Points using ArcGIS 10.2 software in bilinear  
148 interpolation.

### 149 **2.3 Data processing**

150 OriginPro 2021 software was used for hierarchical cluster analysis on *Artemisia* and its outgroup pollen data.  
151 The Euclidean distance was calculated after the normalization of the original data, and the Ward method was  
152 used for clustering. Five groups were established, and the center point of each group was calculated according  
153 to the sum of distances. Pollen morphological traits for the principal component analysis (PCA) of *Artemisia*  
154 and its outgroups and grouped according to the five groups of the cluster analysis. OriginPro 2021 software  
155 was used to draw group violin diagrams and boxplots respectively, and run an ANOVA to test for an overall  
156 difference between the pollen characters of 3 pollen types and testing intraspecific variability in pollen exine  
157 ultrastructure characters among three representative species, followed by post hoc tests (Tukey). OriginPro  
158 2021 software was also used to ~~run correlation coefficients analysed by the Pearson correlation between~~  
159 ~~pollen morphological traits and environmental factors as well as~~ draw group violin diagrams and run a  
160 KWANOVA to test for overall differences between the environmental factors of the 3 pollen types. The  
161 images of habitats reproduced in the text are from the websites listed in Table B1.

162 The global distribution data of the 36 representative species and 3 pollen types were plotted on the map  
163 of terrestrial ecological regions (Olson et al., 2001) using ArcGIS 10.2 software (Figs. 16, [201](#)).

## 164 **3 Data description**

### 165 **3.1 *Artemisia* pollen grains and their source plant habitats**

166 Here we provide detailed data on pollen morphological traits, covering 36 species from 9 main clades of  
167 *Artemisia* and 3 outgroups constrained by the phylogenetic framework (Fig. 1, Sanz et al., 2008; Malik et al.,  
168 2017) under LM and SEM, the habitats of their source plants (Figs. 3-14).

270 **3.2 Statistical pollen morphological trait data of 36 sampled taxa**

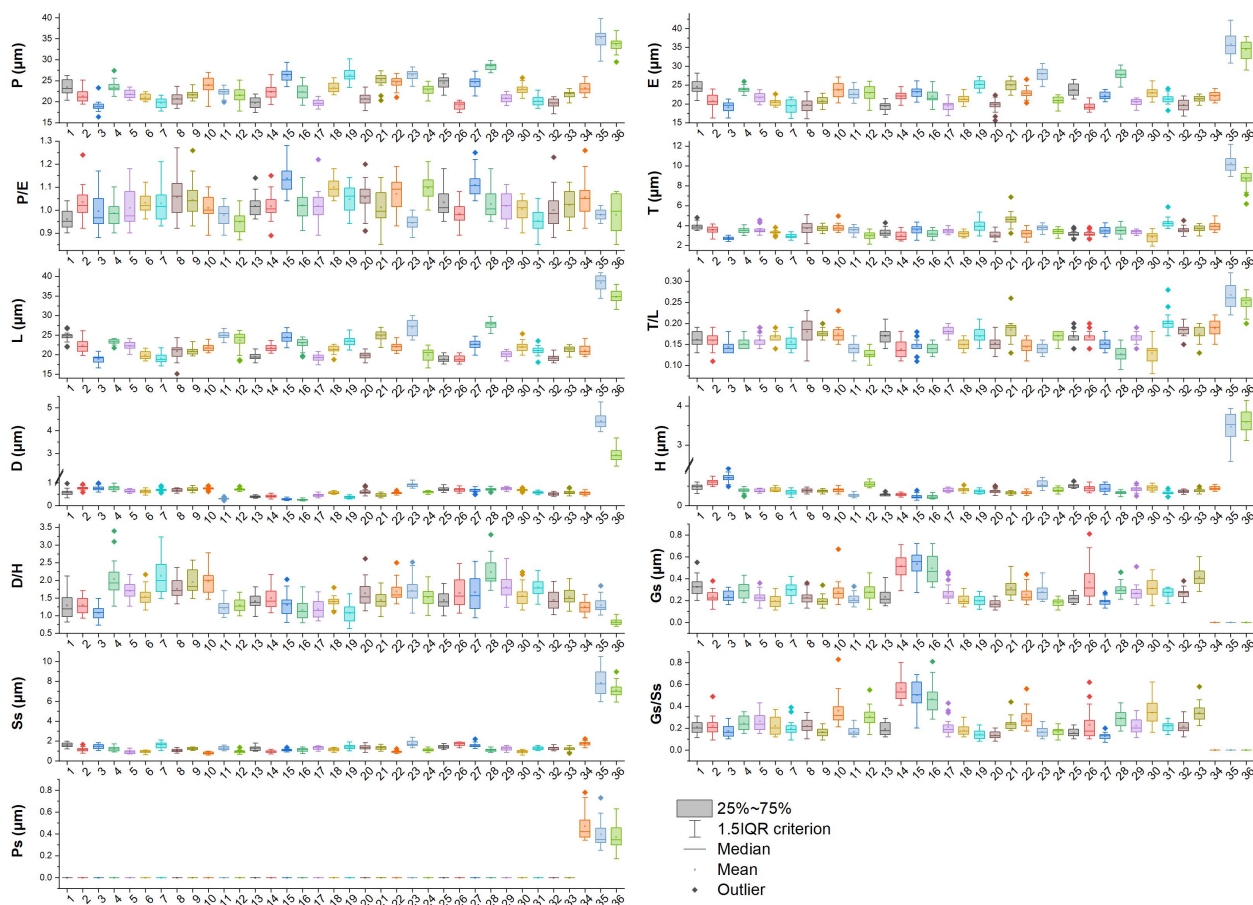

271 The mean values of 10 pollen morphological traits of 36 sampled species are listed in Table 1, and these data  
 272 distribution patterns are shown in boxplots (Fig. 15) in the form of variation (25%-75%), and further  
 273 described in the form of mean value  $\pm$  standard deviation ( $M \pm SD$ , Appendix A).

274 **Table 1.** Pollen morphological traits of 36 selected species (P: Polar length; E: Equatorial width; T: Exine  
 275 thickness; L: Pollen length; D: Diameter of spinule base; H: Spinule height; Gs: Granule spacing; Ss: Spinule  
 276 spacing; Ps: Perforation spacing).

### 288 3.3 The source plant occurrences

289 The source plant distributions in global terrestrial biomes of 36 sampled species are shown in Fig. 16. In  
 290 *Artemisia*, some species have worldwide distributions, such as *A. vulgaris* (Fig. 16-7), *A. absinthium* (Fig.  
 291 16-24), and *A. campestris* (Fig. 16-33); a few taxa are limited to East Asia, such as *A. roxburghiana* (Fig.  
 292 16-10) and *A. blepharolepis* (Fig. 16-26), while others have narrow and isolated distributions in deserts and  
 293 xeric shrublands of Central Asia, e.g. *A. kurramensis* (Fig. 16-13) and *A. aralensis* (Fig. 16-16). In outgroups  
 294 of *Artemisia*, *Kaschagaria brachanthemoides* is also confined to deserts and xeric shrublands of Central Asia  
 295 (Fig. 16-34), while *Ajania pallasiana* lives in forests of East Asia (Fig. 16-35).

296

## 308 **4 Potential use of the *Artemisia* pollen datasets**

### 309 **4.1 The pollen classification of *Artemisia***

310 The pollen grains of Anthemideae and Asteraceae under LM could be simply divided into *Artemisia* pollen  
311 type (Figs. 3-13, 14a, Appendix A) with indistinct and short spinules and *Anthemis* pollen type such as  
312 *Chrysanthemum indicum* and *Ajania pallasiana* (Figs. 14b-c, Appendix A) with distinct and long spines on  
313 pollen exine ornamentation (Wodehouse, 1926; Stix, 1960; Chen, 1987; Chen and Zhang, 1991; Martín et al.,  
314 2001; Martín et al., 2003; Sanz et al., 2008; Blackmore et al., 2009; Vallès et al., 2011). *Artemisia* pollen  
315 grains are difficult to separate from those of other related genera with *Artemisia* pollen type such as  
316 *Kaschgaria brachanthemoides* (Figs. 14a1-2, Appendix A), *Elachanthemum*, *Ajaniopsis*, *Filifolium*, and  
317 *Neopallasia* (Chen and Zhang, 1991) under LM due to their great similarity in pollen exine ornamentation and  
318 colporate patterns (Chen, 1987; Martín et al., 2001; Martín et al., 2003; Vallès et al., 2011). Furthermore, Sing  
319 and Joshi (1969) questioned the feasibility of recognizing pollen types under LM in the highly uniform pollen  
320 of *Artemisia*. Later, SEM made it possible to subdivide the pollen of *Artemisia* and those of other related  
321 genera within the *Artemisia* pollen type using pollen exine ultrastructure characters (Chen, 1987; Chen and  
322 Zhang, 1991; Sun and Xu, 1997; Jiang et al., 2005; Ghahraman et al., 2007; Shan et al., 2007; Hayat et al.,  
323 2009; Hayat et al., 2010; Hussain et al., 2019).

324 Hierarchical cluster analysis (Fig. 17a) revealed that the pollen morphological traits (P/E, H, D, D/H, Ss,  
325 Gs, Gs/Ss, and Ps) of *Artemisia* and its outgroups were divided into Clade A with perforations and without  
326 granules (Figs. 13a5-6, b5-6, c5-6) and Clade B with granules and without perforations (Figs. 3-13a5-6, b5-6,  
327 c5-6) on the pollen exine under SEM.

328  
 329 **Figure 17.** Hierarchical cluster analysis, showing the dendrogram for pollen types from *Artemisia* and  
 330 outgroups (a) and the habitat ranges of 36 representative species (b, Tutin et al., 1976; Zhang, 2007; Ling et al.,  
 331 2011).

332 In addition, Clade A, as the outgroup of *Artemisia*, includes *Anthemis* type (*Chrysanthemum indicum* and  
 333 *Ajania pallasiana*) with prominent spines on pollen exine under LM, and *Kaschgaria* type (*Kaschgaria*  
 334 *brachanthemoides*) with spinules on pollen exine (Figs. 14a, 17a). Clade B comprises three pollen types from  
 335 three branches of *Artemisia* (Fig. 17a), i.e., SG type (short and wide spinule pollen type, Clade B1), LNS type  
 336 (long and narrow spinule pollen type, Clade B2-1), and SG type (sparse granule pollen type, Clade B2-2).

337 Eight pollen morphological traits (P/E, H, D, D/H, Ss, Gs, Gs/Ss, and Ps) were selected for the principal  
 338 component analysis (PCA) of 36 taxa of *Artemisia* and its outgroups (Fig. 18) and grouped according to the  
 339 five clades of the cluster analysis, i.e. the five pollen types (Fig. 17a). The results reveal that *Artemisia* pollen  
 340 morphology differs significantly from that of the outgroups, and that three *Artemisia* pollen types could be  
 341 distinguished.

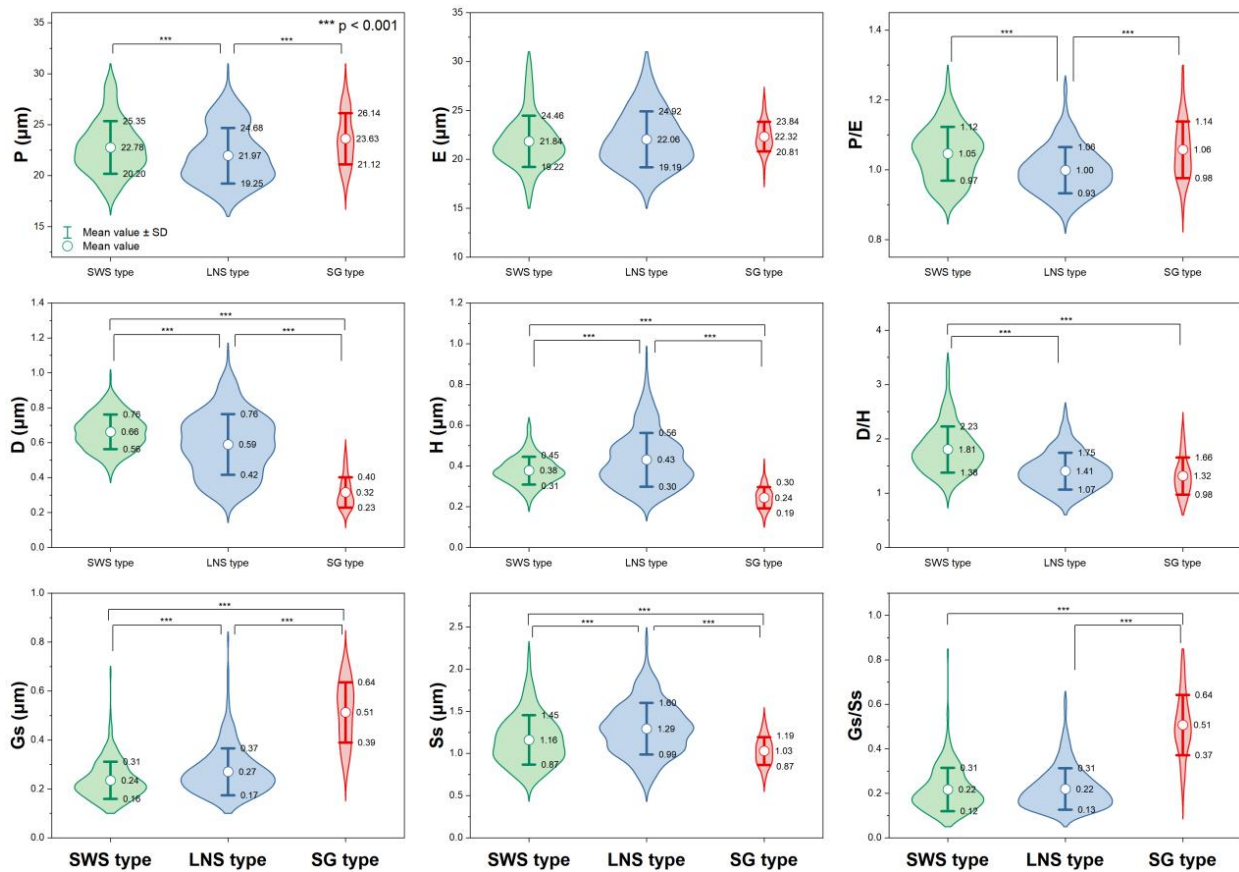

**Figure 18.** Principal component analysis of 36 taxa of *Artemisia* and its outgroups.

Nine characteristics of *Artemisia* pollen could partially explain the differences between these 3 pollen types (Fig. 19). P/E (the length of polar axis/the length of equatorial axis) in LNS types (0.93-1.06) are significantly different (ANOVA  $P < 0.001$ ) from both SWS (0.97-1.12) and SG (0.98-1.14), so could be used to identify the LNS type. D/H (diameter of spinule base/spinule height) in the SWS type differ significantly (ANOVA  $P < 0.001$ ) from both LNS and SG types. The variation range of D/H is 1.38-2.23 in the SWS type, 1.07-1.75 in the LNS type, and 0.98-1.66 in the SG type, indicating that the SWS pollen type is distinguished by short and wide spinules. Gs/Ss (granule spacing/spinule spacing) in the SG type was higher than those of the SWS and LNS types (ANOVA  $P < 0.001$ ), which distinguished the SG type from the other two types. Moreover, the SG type is characterized by sparse granules with the variation range of Gs/Ss spanning 0.37-0.64, while the SWS and LNS types show much denser granules whose Gs/Ss are mainly below 0.35.

Within the new *Artemisia* pollen classification (Fig. 17a, Key), the SWS type represents a type of pollen with short and wide spinules ( $D/H > 1.81$ ) and dense granules (Figs. 17a, 19). The LNS type represents a type of pollen with long and narrow spinules ( $D/H < 1.38$ ) and dense granules (Figs. 17a, 19). The SG type is characterized by sparse granules ( $Gs/Ss > 0.37$ ) and small, long, and narrow spinules (Figs. 17a, 19).

358  
 359 **Figure 19.** Violin diagrams of three pollen types from *Artemisia*, showing the variations ( $M \pm SD$ ) in nine  
 360 pollen characters (P: length of polar axis; E: length of equatorial axis; D: diameter of spinule base; H: spinule  
 361 height; Gs: granule spacing; Ss: spinule spacing; Ps: perforation spacing). Asterisks indicate statistically  
 362 significant differences ( $p < 0.001$ ).

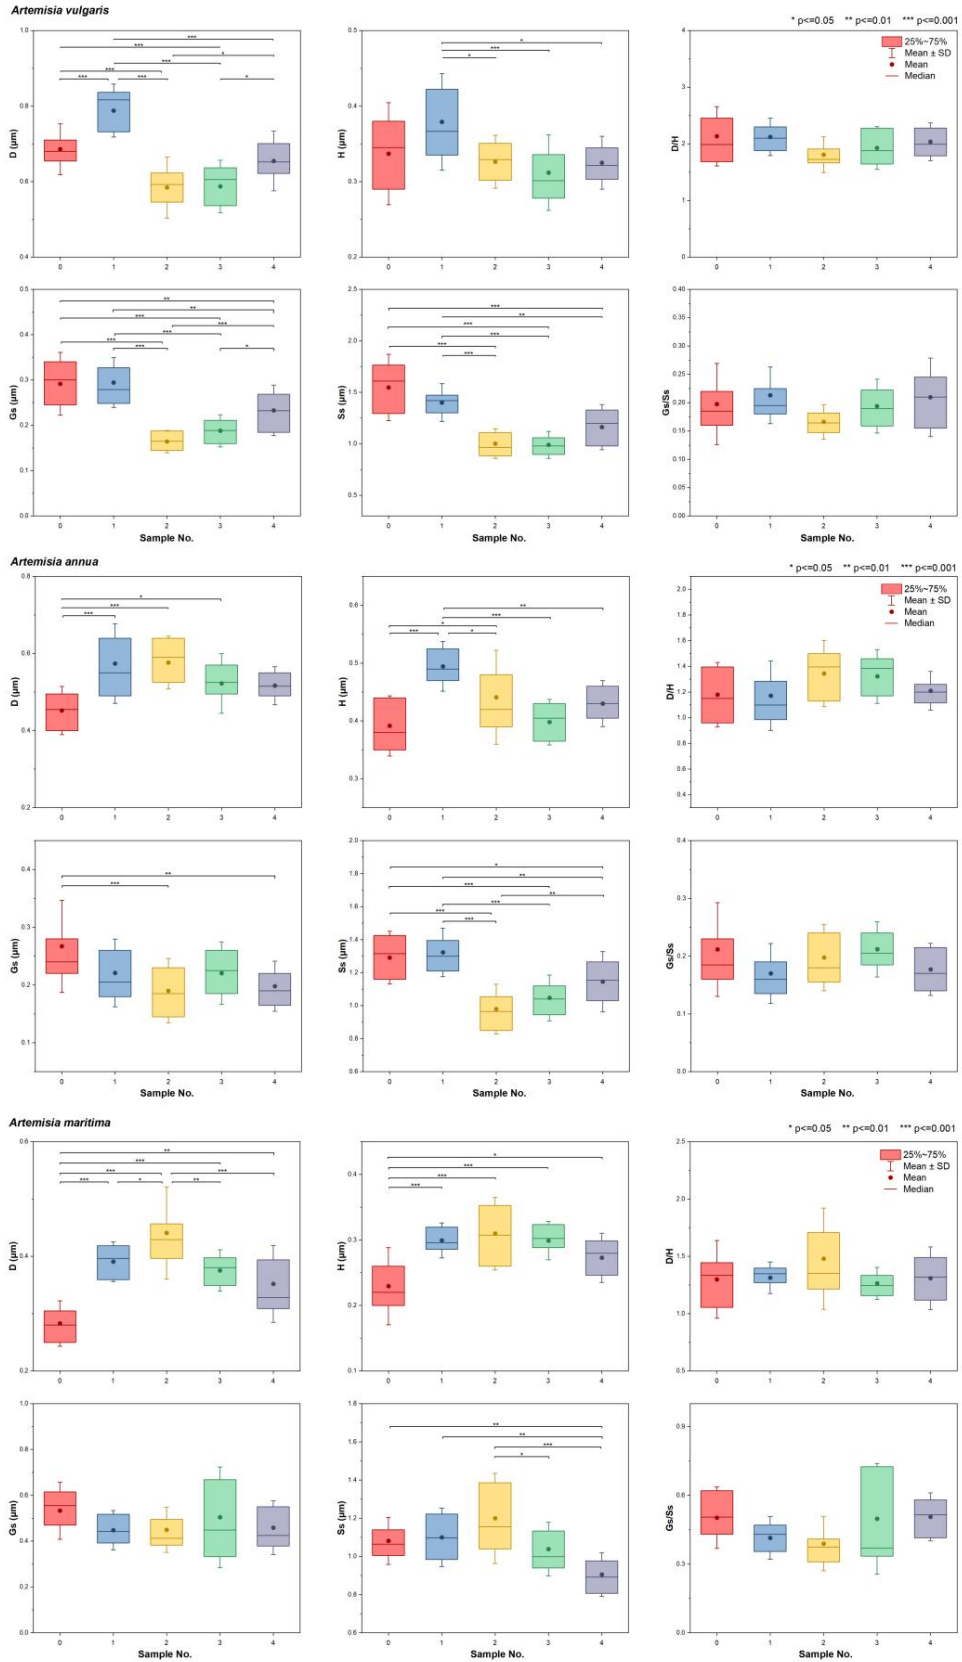

363 **4.2 Testing the pollen intraspecific variability within *Artemisia***

364 Evidence shows that the pollen morphology in *Artemisia* is highly uniform under LM without discrimination  
 365 (Wodehouse, 1926; Sing and Joshi, 1969; Ling, 1982; Chen, 1987; Wang et al., 1995), which might suggest  
 366 that statistical analyses of the intraspecific morphological variation of pollen under the LM are limited or  
 367 meaningless. Right now, the SEM technique has made it possible to subdivide *Artemisia* pollen into different  
 368 types using pollen exine ultrastructure characters (Chen, 1987; Chen and Zhang, 1991; Sun and Xu, 1997;  
 369 Jiang et al., 2005; Ghahraman et al., 2007; Shan et al., 2007; Hayat et al., 2009; Hayat et al., 2010; Hussain et  
 370 al., 2019).

371 In order to test the intraspecific variability of pollen exine ultrastructure traits, we selected one species  
 372 respectively from the three pollen types corresponding to the three morphological clades of *Artemisia* pollen,  
 373 i.e. *Artemisia vulgaris* (SWS type), *Artemisia annua* (LNS type), and *Artemisia maritima* (SG type), and

374 sampled five specimens of each species (Table B2). Six pollen traits, i.e. D, H, D/H, Gs, Ss, and Gs/Ss, were  
375 counted and analysed under SEM to test for intraspecific variability of pollen exine ultrastructure traits.-

376 The test showed that it was feasible to use stable D/H and Gs/Ss for pollen type classification of  
377 *Artemisia* because 1) D/H and Gs/Ss were stable within species (Figure R220, Table R2) for the pollen  
378 classification; 2) D, H, Gs, and Ss were variable as size values, e.g. these four traits were significantly  
379 different within species in both *A. vulgaris* and *A. annua*, while D, H, and Ss were significantly different  
380 within species in *A. maritima* (Figure R220, Table R2). There was evidence showing that size values such as  
381 pollen exine ultrastructure size were often variable within species due to their genetic divergence, various  
382 habitats, and different experimental treatments (Mo et al., 1997; Zhao and Yao, 1999; Zhang and Qian, 2011).

383

384 **Figure 20.** Boxplots of intraspecific pollen exine ultrastructure characters from three species of *Artemisia*,  
 385 showing the variations (M ± SD) in six pollen characters (D: diameter of spinule base; H: spinule height; Gs:  
 386 granule spacing; Ss: spinule spacing; Ps: perforation spacing). Asterisks indicate statistically significant  
 387 differences (\*p <= 0.05, \*\*p <= 0.01, \*\*\*p < 0.001).

388

408 **4.23 The ecological implications of *Artemisia* pollen types**

409 Plotting the distribution data of 33 species from 9 main branches of *Artemisia* constrained by the phylogenetic  
410 framework (Fig. 1) onto the global terrestrial biomes (Fig. 201), we noticed that the genus is widely

411 distributed from forest to grassland, desert, and saline habitats (Figs. 16, 17b, 201). Furthermore, different  
 412 species of *Artemisia* with SWS pollen type (Fig. 201a) and LNS type (Fig. 201b) have a rather wide  
 413 distribution with severely overlapping ranges while those with SG type (Fig. 201c) have narrow and isolated  
 414 distributions.

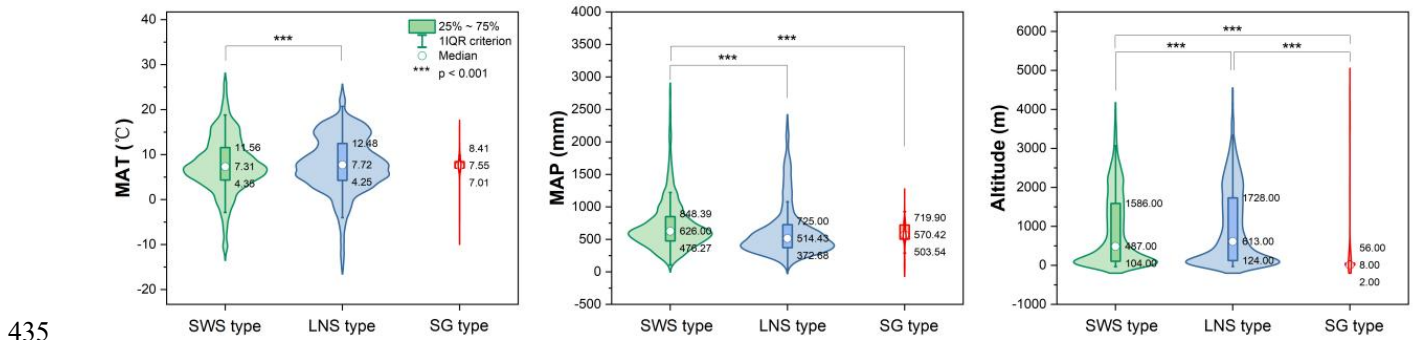

415  
 416 **Figure 210.** The global distribution pattern of 3 *Artemisia* pollen types in terrestrial biomes (modified from  
 417 Olson et al., 2001). a. SG type; b. LNS type; c. SWS type.

418 14 terrestrial biomes: 01. Tropical and Subtropical Moist Broadleaf Forests; 02. Tropical and Subtropical Dry  
 419 Broadleaf Forests; 03. Tropical and Subtropical Coniferous Forests; 04. Temperate Broadleaf and Mixed  
 420 Forests; 05. Temperate Coniferous Forests; 06. Boreal Forests/Taiga; 07. Flooded Grasslands and Savannas;  
 421 08. Montane Grasslands and Shrublands; 09. Tundra; 10. Mediterranean Forests, Woodlands, and Shrub; 11.

422 Tropical and Subtropical Grasslands, Savannas, and Shrublands; 12. Temperate Grasslands, Savannas, and  
423 Shrublands; 13. Deserts and Xeric Shrublands; 14. Mangroves; 15. Lakes; 16. Rock and Ice.

424 The ecological implications of *Artemisia* pollen types mentioned above fall into four categories. (i)  
425 *Artemisia* with the SG pollen type all belong to the subg. *Seriphidium*, which generally grows in dry habitats  
426 ranging from grassland desert to desert and coastal saline-alkaline environments, with their distribution  
427 largely limited to Eurasia and growing at low altitude (Figs. 17b, 201c, 242). (ii) The habitats of *Artemisia*  
428 with LNS pollen type have a global distribution and occur in forest, grassland and desert, and even coastal  
429 areas (Figs. 17b, 201b, 242), with the highest mean annual temperature (MAT). Hence, the LNS pollen type is  
430 a generalist. (iii) *Artemisia* with SWS pollen type include Sect. *Artemisia* and its habitats range from forest to  
431 desert, although most of the taxa are confined to humid environments from forest to grassland with a global  
432 distribution and the highest mean annual precipitation (MAP, Figs. 17b, 201c, 242). (iv) If the SWS pollen  
433 type and the SG pollen type appear together, the range of vegetation types could be reduced to grassland  
434 desert and desert through niche coexistence (Fig. 17b).

436 **Figure 24.** Violin diagrams of three pollen types from *Artemisia*, showing the variations (25%-75%) in MAT,  
437 MAP, and altitude. Asterisks indicate statistically significant differences ( $p < 0.001$ ).

438 In addition, we noticed that *Kaschgaria brachanthemoides* as an outgroup of *Artemisia* lives in dry  
439 mountain valleys or dry riverbeds of Northwest China (Toksun) and Kazakhstan, with highly characteristic  
440 pollen (Fig. 14a), narrow habitats (Fig. 17b), and regional distribution (Fig. 16-34) and has the potential to  
441 indicate some specific habitats.

## 442 5 Data availability

443 Pollen datasets (Table 32) including pollen photographs under LM and SEM, statistical data of pollen  
444 morphological traits, and their source plant distribution for each species are available at Zenodo  
445 (<https://doi.org/10.5281/zenodo.69003086791891>; Lu et al., 2022).

30858 source plant occurrence information, and corresponding environmental factors including altitude and 19 climate parameters.	.xlsx	Their source plant distribution coordinates were obtained from GBIF ( <a href="https://doi.org/10.15468/dl.596xd9">https://doi.org/10.15468/dl.596xd9</a> ). The corresponding environmental factors of these coordinates were obtained from WorldClim ( <a href="https://www.worldclim.org/">https://www.worldclim.org/</a> ) with a spatial resolution of 30 seconds between 1970-2000.	

**6 Summary**

448 To cover the maximum range of *Artemisia* pollen morphological variation, we provide a pollen dataset of 36  
449 species from 9 clades and 3 outgroups of *Artemisia* constrained by the phylogenetic framework, containing  
450 high-quality pollen photographs under LM and SEM, statistical data of pollen morphological traits, together  
451 with their source plant distribution, and corresponding environmental factors. Here, we attempt to decipher the  
452 underlying causes of the long-standing disagreement in the palynological community on the correlation  
453 between *Artemisia* pollen and aridity by recognizing the different ecological implications of *Artemisia* pollen  
454 types.

455 This dataset should work well for identifying and classifying *Artemisia* pollen from Neogene and  
456 Quaternary sediments. While *Artemisia* pollen grains are uniform in morphology under LM, different types  
457 can be recognized under SEM. So, the single-grain technique for picking out fossil pollen grains and  
458 photographing the same grains under LM and SEM should provide valuable insights in the diversity of fossil  
459 *Artemisia* (Ferguson et al., 2007; Grímsson et al., 2011; Grímsson et al., 2012; Halbritter et al., 2018).  
460 Furthermore, those *Artemisia* pollen grains could then be compared with the rich photographs from this  
461 dataset, and together with the key provided here, possibly attributed to one of the three *Artemisia* pollen types,  
462 which in turn may provide a link to the different habitat ranges.

463 However, the application of this dataset probably may not work well for the Palaeogene, as 1) *Artemisia*  
464 might have originated in the Palaeocene, although there is no evidence for a specific location or time interval  
465 of its origin (e.g. Ling 1982; Wang 2004; Miao 2011); 2) both the lack of macrofossils of *Artemisia* and the  
466 strong pollen similarity between *Artemisia* and its closely related taxa under LM might lead to confusion and  
467 more uncertainty in tracing the origin of *Artemisia*. On the other hand, the present dataset provides a potential  
468 morphological tool to distinguish *Artemisia* pollen grains from those of its related taxa at the SEM level and  
469 may shed light on the origin of this genus in the Palaeogene.

470 Moreover, these pollen photographs also have potential and the possibility to be used for deep learning  
471 research. We are attempting to automatically identify pollen images using pollen assemblages from the eastern  
472 Central Asian desert as an example with deep convolutional neural network (DCNN) of artificial intelligence.  
473 Pollen images of the many species of *Artemisia* provided here, and the increasing number of intraspecific  
474 replications in the future, will all serve for projected image identification research.

475 Finally and most importantly, the *Artemisia* pollen dataset as designed is open and expandable for new  
476 pollen data from *Artemisia* worldwide in order to better serve the global environment assessment and refined  
477 reconstruction of vegetation in the geological past as a basis or blueprint for other overarching statistical

478 analyses on pollen morphology.

## 479 **Appendix A**

### 480 **Text A1**

481 Pollen morphological descriptions of 36 representative species from 9 clades of *Artemisia* and 3 outgroups.

482 Pollen morphology of *Artemisia*: pollen grains oblate, spherical, or ellipsoidal; apertures tricolporate; almost  
483 circular in equatorial view and trilobate circular in polar view; the exine near the colpi gradually thinned; the  
484 exine has an obvious double structure of inner and outer layers where the outer is thicker than the inner under  
485 LM; the exine ornamentation is psilate (LM), spinulate and granule (SEM).

#### 486 **1. *Artemisia cana* (Table 1, Figs. 3a, 15)**

487 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
488 Apertures tricolporate. The exine near the colpi gradually thinned. Polar length (P) =  $23.46 \pm 1.76 \mu\text{m}$  (M  $\pm$   
489 SD), equatorial width (E) =  $24.50 \pm 2.13 \mu\text{m}$  (M  $\pm$  SD), P/E =  $0.96 \pm 0.04$  (M  $\pm$  SD), Exine thickness (T) =  
490  $3.91 \pm 0.36 \mu\text{m}$  (M  $\pm$  SD), Pollen length (L) =  $24.58 \pm 1.24 \mu\text{m}$  (M  $\pm$  SD), T/L =  $0.16 \pm 0.02$ . The exine  
491 ornamentation is psilate (LM), spinulate (SEM). Under SEM, diameter of spinule base (D) =  $0.58 \pm 0.13 \mu\text{m}$   
492 (M  $\pm$  SD), spinule height (H) =  $0.46 \pm 0.08 \mu\text{m}$  (M  $\pm$  SD), D/H =  $1.28 \pm 0.38$  (M  $\pm$  SD), granule spacing (Gs)  
493 =  $0.33 \pm 0.08 \mu\text{m}$  (M  $\pm$  SD), spinule spacing (Ss) =  $1.60 \pm 0.22 \mu\text{m}$  (M  $\pm$  SD), Gs/Ss =  $0.21 \pm 0.06$  (M  $\pm$  SD).

494 Habitat: grasslands, gravel soils, mountain meadows, stream banks; Wet mountain meadows, stream banks,  
495 rocky areas with late-lying snows.

#### 496 **2. *Artemisia tridentata* (Table 1, Figs. 3b, 15)**

497 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
498 Apertures tricolporate. The exine near the colpi gradually thinned. P =  $21.36 \pm 1.54 \mu\text{m}$ , E =  $20.69 \pm 1.85 \mu\text{m}$ ,  
499 P/E =  $1.04 \pm 0.07$ , T =  $3.55 \pm 0.41 \mu\text{m}$ , L =  $22.35 \pm 1.90 \mu\text{m}$ , T/L =  $0.16 \pm 0.02$ . The exine ornamentation is  
500 psilate (LM), spinulate (SEM). Under SEM, D =  $0.76 \pm 0.08 \mu\text{m}$ , H =  $0.60 \pm 0.08 \mu\text{m}$ , D/H =  $1.30 \pm 0.23$ , Gs  
501 =  $0.24 \pm 0.06 \mu\text{m}$ , Ss =  $1.12 \pm 0.22 \mu\text{m}$ , Gs/Ss =  $0.22 \pm 0.08$ .

502 Habitat: mountains, grasslands, and meadows of western North America. Arid and semi-arid, desert, or  
503 semi-desert areas of the growing shrub or semi-shrub environment.

#### 504 **3. *Artemisia californica* (Table 1, Figs. 3c, 15)**

505 Pollen grains prolate or spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar  
506 view. Apertures tricolporate. The exine near the colpi gradually thinned. P =  $18.94 \pm 1.30 \mu\text{m}$ , E =  $19.13 \pm$   
507  $1.43 \mu\text{m}$ , P/E =  $0.99 \pm 0.08$ , T =  $2.70 \pm 0.16 \mu\text{m}$ , L =  $18.85 \pm 1.12 \mu\text{m}$ , T/L =  $0.14 \pm 0.01$ . The exine  
508 ornamentation is psilate (LM), spinulate (SEM). Under SEM, D =  $0.75 \pm 0.11 \mu\text{m}$ , H =  $0.71 \pm 0.10 \mu\text{m}$ , D/H =  
509  $1.08 \pm 0.20$ , Gs =  $0.24 \pm 0.05 \mu\text{m}$ , Ss =  $1.45 \pm 0.23 \mu\text{m}$ , Gs/Ss =  $0.17 \pm 0.05$ .

510 Habitat: coastal scrub, dry foothills.

511 **4. *Artemisia indica* (Table 1, Figs. 4a, 15)**

512 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
513 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 23.47 \pm 1.39 \mu\text{m}$ ,  $E = 23.81 \pm 0.86 \mu\text{m}$ ,  
514  $P/E = 0.99 \pm 0.06$ ,  $T = 3.50 \pm 0.27 \mu\text{m}$ ,  $L = 23.31 \pm 0.61 \mu\text{m}$ ,  $T/L = 0.15 \pm 0.01$ . The exine ornamentation is  
515 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.76 \pm 0.10 \mu\text{m}$ ,  $H = 0.39 \pm 0.06 \mu\text{m}$ ,  $D/H = 2.04 \pm 0.53$ ,  $G_s$   
516  $= 0.28 \pm 0.07 \mu\text{m}$ ,  $S_s = 1.21 \pm 0.24 \mu\text{m}$ ,  $G_s/S_s = 0.24 \pm 0.07$ .

517 Habitat: roadsides, forest margins, slopes, shrublands; low elevations to 2000 m.

518 **5. *Artemisia argyi* (Table 1, Figs. 4b, 15)**

519 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
520 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 21.80 \pm 1.00 \mu\text{m}$ ,  $E = 21.67 \pm 1.27 \mu\text{m}$ ,  
521  $P/E = 1.01 \pm 0.08$ ,  $T = 3.55 \pm 0.40 \mu\text{m}$ ,  $L = 22.24 \pm 1.13 \mu\text{m}$ ,  $T/L = 0.16 \pm 0.01$ . The exine ornamentation is  
522 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.64 \pm 0.07 \mu\text{m}$ ,  $H = 0.38 \pm 0.04 \mu\text{m}$ ,  $D/H = 1.71 \pm 0.23$ ,  $G_s$   
523  $= 0.22 \pm 0.06 \mu\text{m}$ ,  $S_s = 0.90 \pm 0.17 \mu\text{m}$ ,  $G_s/S_s = 0.26 \pm 0.09$ .

524 Habitat: waste places, roadsides, slopes, hills, steppes, forest steppes; low elevations to 1500 m.

525 **6. *Artemisia mongolica* (Table 1, Figs. 4c, 15)**

526 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
527 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 21.05 \pm 0.82 \mu\text{m}$ ,  $E = 20.42 \pm 1.01 \mu\text{m}$ ,  
528  $P/E = 1.03 \pm 0.05$ ,  $T = 3.29 \pm 0.19 \mu\text{m}$ ,  $L = 19.78 \pm 0.99 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.01$ . The exine ornamentation is  
529 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.62 \pm 0.08 \mu\text{m}$ ,  $H = 0.41 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.54 \pm 0.25$ ,  $G_s$   
530  $= 0.19 \pm 0.06 \mu\text{m}$ ,  $S_s = 0.91 \pm 0.14 \mu\text{m}$ ,  $G_s/S_s = 0.22 \pm 0.08$ .

531 Habitat: slopes, shrublands, riverbanks, lakeshores, roadsides, steppes, forest steppes, dry valleys; low  
532 elevations to 2000 m.

533 **7. *Artemisia vulgaris* (Table 1, Figs. 5a, 15)**

534 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
535 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 19.72 \pm 1.25 \mu\text{m}$ ,  $E = 19.29 \pm 1.82 \mu\text{m}$ ,  
536  $P/E = 1.03 \pm 0.08$ ,  $T = 2.92 \pm 0.23 \mu\text{m}$ ,  $L = 18.94 \pm 1.09 \mu\text{m}$ ,  $T/L = 0.16 \pm 0.02$ . The exine ornamentation is  
537 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.69 \pm 0.07 \mu\text{m}$ ,  $H = 0.34 \pm 0.07 \mu\text{m}$ ,  $D/H = 2.13 \pm 0.52$ ,  $G_s$   
538  $= 0.29 \pm 0.07 \mu\text{m}$ ,  $S_s = 1.55 \pm 0.32 \mu\text{m}$ ,  $G_s/S_s = 0.20 \pm 0.07$ .

539 Habitat: roadsides, slopes, canyons, forest margins, forest steppes, subalpine steppes; 1500-3800 m.

540 **8. *Artemisia selengensis* (Table 1, Figs. 5b, 15)**

541 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
542 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 20.67 \pm 1.57 \mu\text{m}$ ,  $E = 19.68 \pm 1.94 \mu\text{m}$ ,  
543  $P/E = 1.06 \pm 0.09$ ,  $T = 3.72 \pm 0.72 \mu\text{m}$ ,  $L = 20.80 \pm 2.21 \mu\text{m}$ ,  $T/L = 0.18 \pm 0.03$ . The exine ornamentation is  
544 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.67 \pm 0.08 \mu\text{m}$ ,  $H = 0.38 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.76 \pm 0.27$ ,  $G_s$   
545  $= 0.22 \pm 0.06 \mu\text{m}$ ,  $S_s = 1.05 \pm 0.15 \mu\text{m}$ ,  $G_s/S_s = 0.22 \pm 0.07$ .

546 Habitat: riverbanks, lakeshores, humid areas, meadows, slopes, roadsides.

#### 547 **9. *Artemisia ludoviciana* (Table 1, Figs. 5c, 15)**

548 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
549 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 21.65 \pm 1.02 \mu\text{m}$ ,  $E = 20.82 \pm 1.10 \mu\text{m}$ ,  
550  $P/E = 1.04 \pm 0.08$ ,  $T = 3.71 \pm 0.28 \mu\text{m}$ ,  $L = 20.94 \pm 1.13 \mu\text{m}$ ,  $T/L = 0.18 \pm 0.01$ . The exine ornamentation is  
551 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.70 \pm 0.08 \mu\text{m}$ ,  $H = 0.37 \pm 0.04 \mu\text{m}$ ,  $D/H = 1.94 \pm 0.31$ ,  $G_s$   
552  $= 0.20 \pm 0.05 \mu\text{m}$ ,  $S_s = 1.23 \pm 0.13 \mu\text{m}$ ,  $G_s/S_s = 0.16 \pm 0.04$ .

553 Habitat: disturbed roadsides, open meadows, rocky slopes.

#### 554 **10. *Artemisia roxburghiana* (Table 1, Figs. 6a, 15)**

555 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
556 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 23.88 \pm 2.04 \mu\text{m}$ ,  $E = 23.69 \pm 2.00 \mu\text{m}$ ,  
557  $P/E = 1.01 \pm 0.06$ ,  $T = 3.78 \pm 0.39 \mu\text{m}$ ,  $L = 21.81 \pm 1.05 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.02$ . The exine ornamentation is  
558 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.76 \pm 0.07 \mu\text{m}$ ,  $H = 0.39 \pm 0.06 \mu\text{m}$ ,  $D/H = 1.96 \pm 0.37$ ,  $G_s$   
559  $= 0.28 \pm 0.11 \mu\text{m}$ ,  $S_s = 0.79 \pm 0.11 \mu\text{m}$ ,  $G_s/S_s = 0.36 \pm 0.14$ .

560 Habitat: roadsides, slopes, dry canyons, grasslands, waste areas, terraces; 700-3900 m.

#### 561 **11. *Artemisia rutifolia* (Table 1, Figs. 6b, 15)**

562 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
563 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 22.22 \pm 1.10 \mu\text{m}$ ,  $E = 22.70 \pm 1.37 \mu\text{m}$ ,  
564  $P/E = 0.98 \pm 0.05$ ,  $T = 3.53 \pm 0.37 \mu\text{m}$ ,  $L = 24.93 \pm 1.05 \mu\text{m}$ ,  $T/L = 0.14 \pm 0.01$ . The exine ornamentation is  
565 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.31 \pm 0.04 \mu\text{m}$ ,  $H = 0.26 \pm 0.04 \mu\text{m}$ ,  $D/H = 1.20 \pm 0.18$ ,  $G_s$   
566  $= 0.21 \pm 0.05 \mu\text{m}$ ,  $S_s = 1.27 \pm 0.19 \mu\text{m}$ ,  $G_s/S_s = 0.17 \pm 0.04$ .

567 Habitat: hills, dry river valleys, basins, steppes, semideserts, stony desert; 1300-5000 m.

#### 568 **12. *Artemisia chinensis* (Table 1, Figs. 6c, 15)**

569 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
570 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 21.53 \pm 1.95 \mu\text{m}$ ,  $E = 22.75 \pm 2.00 \mu\text{m}$ ,  
571  $P/E = 0.95 \pm 0.05$ ,  $T = 2.97 \pm 0.40 \mu\text{m}$ ,  $L = 23.71 \pm 2.30 \mu\text{m}$ ,  $T/L = 0.13 \pm 0.01$ . The exine ornamentation is

572 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.70 \pm 0.05 \mu\text{m}$ ,  $H = 0.55 \pm 0.07 \mu\text{m}$ ,  $D/H = 1.29 \pm 0.19$ ,  $G_s$   
573  $= 0.27 \pm 0.07 \mu\text{m}$ ,  $S_s = 0.91 \pm 0.17 \mu\text{m}$ ,  $G_s/S_s = 0.31 \pm 0.09$ .

574 Habitat: littoral plants found on raised coral outcrops.

575 **13. *Artemisia kurramensis* (Table 1, Figs. 7a, 15)**

576 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
577 tricolporate. The exine near the colpi gradually thinned.  $P = 19.71 \pm 1.28 \mu\text{m}$ ,  $E = 19.35 \pm 1.02 \mu\text{m}$ ,  $P/E = 1.02$   
578  $\pm 0.05$ ,  $T = 3.30 \pm 0.38 \mu\text{m}$ ,  $L = 19.44 \pm 0.92 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.02$ . The exine ornamentation is psilate (LM),  
579 spinulate (SEM). Under SEM,  $D = 0.38 \pm 0.04 \mu\text{m}$ ,  $H = 0.27 \pm 0.03 \mu\text{m}$ ,  $D/H = 1.41 \pm 0.21$ ,  $G_s = 0.23 \pm 0.07$   
580  $\mu\text{m}$ ,  $S_s = 1.25 \pm 0.21 \mu\text{m}$ ,  $G_s/S_s = 0.19 \pm 0.06$ .

581 Habitat: foothills, mountain slopes, dry graveyards, field borders with sparse vegetation on gravelly, fine to  
582 coarse sandy-clay soils.

583 **14. *Artemisia compactum* (Table 1, Figs. 7b, 15)**

584 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
585 tricolporate. The exine near the colpi gradually thinned.  $P = 22.33 \pm 1.81 \mu\text{m}$ ,  $E = 21.97 \pm 1.23 \mu\text{m}$ ,  $P/E = 1.02$   
586  $\pm 0.06$ ,  $T = 2.97 \pm 0.43 \mu\text{m}$ ,  $L = 21.67 \pm 0.87 \mu\text{m}$ ,  $T/L = 0.14 \pm 0.02$ . The exine ornamentation is psilate (LM),  
587 spinulate (SEM). Under SEM,  $D = 0.41 \pm 0.07 \mu\text{m}$ ,  $H = 0.28 \pm 0.03 \mu\text{m}$ ,  $D/H = 1.50 \pm 0.33$ ,  $G_s = 0.51 \pm 0.12$   
588  $\mu\text{m}$ ,  $S_s = 0.92 \pm 0.12 \mu\text{m}$ ,  $G_s/S_s = 0.56 \pm 0.12$ .

589 Habitat: rocky slopes, semi-deserts, from low elevations to sub-alpine areas.

590 **15. *Artemisia maritima* (Table 1, Figs. 7c, 15)**

591 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
592 tricolporate. The exine near the colpi gradually thinned.  $P = 26.24 \pm 1.61 \mu\text{m}$ ,  $E = 23.09 \pm 1.43 \mu\text{m}$ ,  $P/E = 1.14$   
593  $\pm 0.06$ ,  $T = 3.54 \pm 0.44 \mu\text{m}$ ,  $L = 24.42 \pm 1.51 \mu\text{m}$ ,  $T/L = 0.14 \pm 0.02$ . The exine ornamentation is psilate (LM),  
594 spinulate (SEM). Under SEM,  $D = 0.28 \pm 0.04 \mu\text{m}$ ,  $H = 0.23 \pm 0.06 \mu\text{m}$ ,  $D/H = 1.30 \pm 0.34$ ,  $G_s = 0.53 \pm 0.12$   
595  $\mu\text{m}$ ,  $S_s = 1.08 \pm 0.12 \mu\text{m}$ ,  $G_s/S_s = 0.50 \pm 0.13$ .

596 Habitat: saltmarsh, dry and calcareous hillsides, seashores, and dry saline or alkaline soils.

597 **16. *Artemisia aralensis* (Table 1, Figs. 8a, 15)**

598 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
599 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 22.32 \pm 1.72 \mu\text{m}$ ,  $E = 21.91 \pm 1.63 \mu\text{m}$ ,  
600  $P/E = 1.02 \pm 0.06$ ,  $T = 3.16 \pm 0.36 \mu\text{m}$ ,  $L = 22.76 \pm 1.45 \mu\text{m}$ ,  $T/L = 0.14 \pm 0.01$ . The exine ornamentation is  
601 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.25 \pm 0.04 \mu\text{m}$ ,  $H = 0.22 \pm 0.04 \mu\text{m}$ ,  $D/H = 1.16 \pm 0.28$ ,  $G_s$   
602  $= 0.50 \pm 0.13 \mu\text{m}$ ,  $S_s = 1.09 \pm 0.18 \mu\text{m}$ ,  $G_s/S_s = 0.46 \pm 0.14$ .

603 Habitat: clayey, sandy loam, solonetzic soils.

604 **17. *Artemisia annua* (Table 1, Figs. 8b, 15)**

605 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
606 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 19.71 \pm 0.84 \mu\text{m}$ ,  $E = 19.45 \pm 1.32 \mu\text{m}$ ,  
607  $P/E = 1.02 \pm 0.07$ ,  $T = 3.45 \pm 0.25 \mu\text{m}$ ,  $L = 19.20 \pm 0.92 \mu\text{m}$ ,  $T/L = 0.18 \pm 0.01$ . The exine ornamentation is  
608 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.45 \pm 0.06 \mu\text{m}$ ,  $H = 0.39 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.18 \pm 0.25$ ,  $G_s$   
609  $= 0.27 \pm 0.08 \mu\text{m}$ ,  $S_s = 1.29 \pm 0.16 \mu\text{m}$ ,  $G_s/S_s = 0.21 \pm 0.08$ .

610 Habitat: hills, waysides, wastelands, outer forest margins, steppes, forest steppes, dry flood lands, terraces,  
611 semidesert steppes, rocky slopes, roadsides, saline soils; 2000-3700 m.

612 **18. *Artemisia freyniana* (Table 1, Figs. 8c, 15)**

613 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
614 tricolporate. The exine near the colpi gradually thinned.  $P = 23.39 \pm 1.21 \mu\text{m}$ ,  $E = 21.30 \pm 1.07 \mu\text{m}$ ,  $P/E = 1.10$   
615  $\pm 0.04$ ,  $T = 3.17 \pm 0.26 \mu\text{m}$ ,  $L = 21.29 \pm 0.95 \mu\text{m}$ ,  $T/L = 0.15 \pm 0.01$ . The exine ornamentation is psilate (LM),  
616 spinulate (SEM). Under SEM,  $D = 0.56 \pm 0.05 \mu\text{m}$ ,  $H = 0.40 \pm 0.06 \mu\text{m}$ ,  $D/H = 1.40 \pm 0.15$ ,  $G_s = 0.20 \pm 0.05$   
617  $\mu\text{m}$ ,  $S_s = 1.15 \pm 0.15 \mu\text{m}$ ,  $G_s/S_s = 0.18 \pm 0.05$ .

618 Habitat: steppes, slopes, dry river valleys, riverbanks, outer forest margins.

619 **19. *Artemisia stechmanniana* (Table 1, Figs. 9a, 15)**

620 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
621 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 26.31 \pm 1.48 \mu\text{m}$ ,  $E = 25.16 \pm 1.22 \mu\text{m}$ ,  
622  $P/E = 1.05 \pm 0.07$ ,  $T = 3.97 \pm 0.60 \mu\text{m}$ ,  $L = 23.45 \pm 1.38 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.02$ . The exine ornamentation is  
623 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.37 \pm 0.05 \mu\text{m}$ ,  $H = 0.35 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.07 \pm 0.25$ ,  $G_s$   
624  $= 0.19 \pm 0.04 \mu\text{m}$ ,  $S_s = 1.40 \pm 0.24 \mu\text{m}$ ,  $G_s/S_s = 0.14 \pm 0.04$ .

625 Habitat: hillsides, roadsides, shrubland, and forest-steppe areas, and often becoming the dominant species or  
626 main associated species of plant communities in some areas of mountainous sunny slopes.

627 **20. *Artemisia pontica* (Table 1, Figs. 9b, 15)**

628 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
629 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 20.64 \pm 1.54 \mu\text{m}$ ,  $E = 19.62 \pm 1.59 \mu\text{m}$ ,  
630  $P/E = 1.05 \pm 0.07$ ,  $T = 3.01 \pm 0.39 \mu\text{m}$ ,  $L = 19.75 \pm 0.84 \mu\text{m}$ ,  $T/L = 0.15 \pm 0.02$ . The exine ornamentation is  
631 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.60 \pm 0.11 \mu\text{m}$ ,  $H = 0.37 \pm 0.06 \mu\text{m}$ ,  $D/H = 1.63 \pm 0.37$ ,  $G_s$   
632  $= 0.17 \pm 0.04 \mu\text{m}$ ,  $S_s = 1.32 \pm 0.27 \mu\text{m}$ ,  $G_s/S_s = 0.13 \pm 0.04$ .

633 Habitat: rocky slopes, dry valleys, steppes, hills; low to middle elevations.

634 **21. *Artemisia frigida* (Table 1, Figs. 9c, 15)**

635 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
636 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 25.11 \pm 1.75 \mu\text{m}$ ,  $E = 24.90 \pm 1.48 \mu\text{m}$ ,  
637  $P/E = 1.01 \pm 0.07$ ,  $T = 4.61 \pm 0.74 \mu\text{m}$ ,  $L = 24.83 \pm 1.27 \mu\text{m}$ ,  $T/L = 0.19 \pm 0.02$ . The exine ornamentation is  
638 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.46 \pm 0.08 \mu\text{m}$ ,  $H = 0.32 \pm 0.04 \mu\text{m}$ ,  $D/H = 1.44 \pm 0.26$ ,  $G_s$   
639  $= 0.31 \pm 0.08 \mu\text{m}$ ,  $S_s = 1.30 \pm 0.18 \mu\text{m}$ ,  $G_s/S_s = 0.24 \pm 0.06$ .

640 Habitat: steppes, sub-alpine meadows, dry hillsides, stable dunes, dry waste areas; 1000-4000 m.

641 **22. *Artemisia rupestris* (Table 1, Figs. 10a, 15)**

642 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
643 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 24.45 \pm 1.41 \mu\text{m}$ ,  $E = 22.92 \pm 1.40 \mu\text{m}$ ,  
644  $P/E = 1.07 \pm 0.08$ ,  $T = 3.18 \pm 0.40 \mu\text{m}$ ,  $L = 21.96 \pm 1.15 \mu\text{m}$ ,  $T/L = 0.14 \pm 0.02$ . The exine ornamentation is  
645 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.55 \pm 0.05 \mu\text{m}$ ,  $H = 0.33 \pm 0.04 \mu\text{m}$ ,  $D/H = 1.68 \pm 0.28$ ,  $G_s$   
646  $= 0.25 \pm 0.07 \mu\text{m}$ ,  $S_s = 0.91 \pm 0.11 \mu\text{m}$ ,  $G_s/S_s = 0.28 \pm 0.09$ .

647 Habitat: dry hills, desert or semidesert steppes, grassy marshlands, dry river valleys, riverbeds, scrub, forest  
648 margins.

649 **23. *Artemisia sericea* (Table 1, Figs. 10b, 15)**

650 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
651 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 26.31 \pm 1.31 \mu\text{m}$ ,  $E = 27.90 \pm 1.67 \mu\text{m}$ ,  
652  $P/E = 0.94 \pm 0.03$ ,  $T = 3.75 \pm 0.32 \mu\text{m}$ ,  $L = 26.89 \pm 2.12 \mu\text{m}$ ,  $T/L = 0.14 \pm 0.01$ . The exine ornamentation is  
653 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.89 \pm 0.09 \mu\text{m}$ ,  $H = 0.54 \pm 0.10 \mu\text{m}$ ,  $D/H = 1.71 \pm 0.36$ ,  $G_s$   
654  $= 0.28 \pm 0.07 \mu\text{m}$ ,  $S_s = 1.74 \pm 0.31 \mu\text{m}$ ,  $G_s/S_s = 0.16 \pm 0.05$ .

655 Habitat: Forest margins, hills, steppes, canyons, waste areas.

656 **24. *Artemisia absinthium* (Table 1, Figs. 10c, 15)**

657 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
658 tricolporate. The exine near the colpi gradually thinned.  $P = 22.79 \pm 1.22 \mu\text{m}$ ,  $E = 20.84 \pm 1.11 \mu\text{m}$ ,  $P/E = 1.09$   
659  $\pm 0.05$ ,  $T = 3.39 \pm 0.31 \mu\text{m}$ ,  $L = 19.92 \pm 1.74 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.01$ . The exine ornamentation is psilate (LM),  
660 spinulate (SEM). Under SEM,  $D = 0.59 \pm 0.05 \mu\text{m}$ ,  $H = 0.40 \pm 0.06 \mu\text{m}$ ,  $D/H = 1.52 \pm 0.25$ ,  $G_s = 0.18 \pm 0.04$   
661  $\mu\text{m}$ ,  $S_s = 1.11 \pm 0.15 \mu\text{m}$ ,  $G_s/S_s = 0.16 \pm 0.04$ .

662 Habitat: hillsides, steppes, scrub, forest margins, often in locally moist situations; 1100-1500 m.

663 **25. *Artemisia abrotanum* (Table 1, Figs. 11a, 15)**

664 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
665 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 24.47 \pm 1.56 \mu\text{m}$ ,  $E = 23.73 \pm 1.65 \mu\text{m}$ ,  
666  $P/E = 1.03 \pm 0.07$ ,  $T = 3.15 \pm 0.28 \mu\text{m}$ ,  $L = 18.82 \pm 0.81 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.01$ . The exine ornamentation is  
667 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.72 \pm 0.10 \mu\text{m}$ ,  $H = 0.51 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.44 \pm 0.25$ ,  $G_s$   
668  $= 0.22 \pm 0.04 \mu\text{m}$ ,  $S_s = 1.41 \pm 0.19 \mu\text{m}$ ,  $G_s/S_s = 0.16 \pm 0.04$ .

669 Habitat: the wasteland of western, southern, central, and southern Europe.

670 **26. *Artemisia blepharolepis* (Table 1, Figs. 11b, 15)**

671 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
672 tricolporate. The exine near the colpi gradually thinned.  $P = 18.96 \pm 0.98 \mu\text{m}$ ,  $E = 19.26 \pm 0.99 \mu\text{m}$ ,  $P/E = 0.99$   
673  $\pm 0.05$ ,  $T = 3.15 \pm 0.28 \mu\text{m}$ ,  $L = 18.82 \pm 0.81 \mu\text{m}$ ,  $T/L = 0.17 \pm 0.01$ . The exine ornamentation is psilate (LM),  
674 spinulate (SEM). Under SEM,  $D = 0.69 \pm 0.09 \mu\text{m}$ ,  $H = 0.44 \pm 0.07 \mu\text{m}$ ,  $D/H = 1.64 \pm 0.44$ ,  $G_s = 0.37 \pm 0.18$   
675  $\mu\text{m}$ ,  $S_s = 1.68 \pm 0.20 \mu\text{m}$ ,  $G_s/S_s = 0.23 \pm 0.14$ .

676 Habitat: low-altitude areas of dry slopes, grasslands, steppes, waste areas, roadsides, dunes near riverbanks.

677 **27. *Artemisia norvegica* (Table 1, Figs. 11c, 15)**

678 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
679 tricolporate. The exine near the colpi gradually thinned.  $P = 24.51 \pm 1.40 \mu\text{m}$ ,  $E = 22.11 \pm 1.05 \mu\text{m}$ ,  $P/E = 1.11$   
680  $\pm 0.06$ ,  $T = 3.48 \pm 0.39 \mu\text{m}$ ,  $L = 22.61 \pm 1.31 \mu\text{m}$ ,  $T/L = 0.15 \pm 0.01$ . The exine ornamentation is psilate (LM),  
681 spinulate (SEM). Under SEM,  $D = 0.67 \pm 0.08 \mu\text{m}$ ,  $H = 0.43 \pm 0.11 \mu\text{m}$ ,  $D/H = 1.66 \pm 0.51$ ,  $G_s = 0.19 \pm 0.03$   
682  $\mu\text{m}$ ,  $S_s = 1.56 \pm 0.24 \mu\text{m}$ ,  $G_s/S_s = 0.12 \pm 0.03$ .

683 Habitat: bare stony ground, *Racomitrium* heath, bouldery crests of solifluction terraces, and sometimes  
684 hollows between rocks.

685 **28. *Artemisia tanacetifolia* (Table 1, Figs. 12a, 15)**

686 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
687 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 28.38 \pm 0.90 \mu\text{m}$ ,  $E = 27.75 \pm 1.70 \mu\text{m}$ ,  
688  $P/E = 1.03 \pm 0.06$ ,  $T = 3.46 \pm 0.47 \mu\text{m}$ ,  $L = 27.63 \pm 1.06 \mu\text{m}$ ,  $T/L = 0.13 \pm 0.02$ . The exine ornamentation is  
689 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.71 \pm 0.06 \mu\text{m}$ ,  $H = 0.32 \pm 0.04 \mu\text{m}$ ,  $D/H = 2.23 \pm 0.40$ ,  $G_s$   
690  $= 0.30 \pm 0.07 \mu\text{m}$ ,  $S_s = 1.08 \pm 0.16 \mu\text{m}$ ,  $G_s/S_s = 0.29 \pm 0.07$ .

691 Habitat: middle and low-altitude areas of forest grasslands, grasslands, meadows, forest edges, open forests,  
692 salty grasslands, grass slopes, and brushwood.

693 **29. *Artemisia tournefortiana* (Table 1, Figs. 12b, 15)**

694 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
695 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 20.76 \pm 0.98 \mu\text{m}$ ,  $E = 20.43 \pm 0.83 \mu\text{m}$ ,

696 P/E =  $1.02 \pm 0.06$ , T =  $3.33 \pm 0.19 \mu\text{m}$ , L =  $20.03 \pm 0.79 \mu\text{m}$ , T/L =  $0.17 \pm 0.01$ . The exine ornamentation is  
697 psilate (LM), spinulate (SEM). Under SEM, D =  $0.73 \pm 0.06 \mu\text{m}$ , H =  $0.42 \pm 0.07 \mu\text{m}$ , D/H =  $1.81 \pm 0.33$ , Gs  
698 =  $0.26 \pm 0.07 \mu\text{m}$ , Ss =  $1.25 \pm 0.20 \mu\text{m}$ , Gs/Ss =  $0.22 \pm 0.08$ .

699 Habitat: widely distributed on hills, terraces, dry flood lands, waste fields, steppes, open forests,  
700 semi-marshlands.

### 701 **30. *Artemisia dracunculus* (Table 1, Figs. 12c, 15)**

702 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
703 tricolporate. The exine near the colpi gradually thinned. P =  $22.89 \pm 1.24 \mu\text{m}$ , E =  $22.87 \pm 1.32 \mu\text{m}$ , P/E =  $1.00$   
704  $\pm 0.05$ , T =  $2.82 \pm 0.52 \mu\text{m}$ , L =  $21.91 \pm 1.35 \mu\text{m}$ , T/L =  $0.13 \pm 0.03$ . The exine ornamentation is psilate (LM),  
705 spinulate (SEM). Under SEM, D =  $0.68 \pm 0.05 \mu\text{m}$ , H =  $0.45 \pm 0.07 \mu\text{m}$ , D/H =  $1.56 \pm 0.31$ , Gs =  $0.31 \pm 0.10$   
706  $\mu\text{m}$ , Ss =  $0.92 \pm 0.15 \mu\text{m}$ , Gs/Ss =  $0.34 \pm 0.11$ .

707 Habitat: dry slopes, steppes, semidesert steppes, forest steppes, forest margins, waste areas, roadsides, terraces,  
708 subalpine meadows, meadow steppes, dry river valleys, rocky slopes, saline-alkaline soils; 500-3800 m.

### 709 **31. *Artemisia japonica* (Table 1, Figs. 13a, 15)**

710 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
711 Apertures tricolporate. The exine near the colpi gradually thinned. P =  $20.18 \pm 1.28 \mu\text{m}$ , E =  $21.23 \pm 1.26 \mu\text{m}$ ,  
712 P/E =  $0.95 \pm 0.05$ , T =  $4.24 \pm 0.49 \mu\text{m}$ , L =  $21.02 \pm 1.14 \mu\text{m}$ , T/L =  $0.20 \pm 0.02$ . The exine ornamentation is  
713 psilate (LM), spinulate (SEM). Under SEM, D =  $0.57 \pm 0.05 \mu\text{m}$ , H =  $0.32 \pm 0.05 \mu\text{m}$ , D/H =  $1.80 \pm 0.24$ , Gs  
714 =  $0.26 \pm 0.05 \mu\text{m}$ , Ss =  $1.26 \pm 0.16 \mu\text{m}$ , Gs/Ss =  $0.21 \pm 0.04$ .

715 Habitat: forest margins, waste areas, shrublands, hills, slopes, roadsides. Low elevations to 3300 m.

### 716 **32. *Artemisia capillaris* (Table 1, Figs. 13b, 15)**

717 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.  
718 Apertures tricolporate. The exine near the colpi gradually thinned. P =  $19.53 \pm 1.09 \mu\text{m}$ , E =  $19.64 \pm 1.62 \mu\text{m}$ ,  
719 P/E =  $1.00 \pm 0.08$ , T =  $3.54 \pm 0.34 \mu\text{m}$ , L =  $19.18 \pm 0.97 \mu\text{m}$ , T/L =  $0.18 \pm 0.01$ . The exine ornamentation is  
720 psilate (LM), spinulate (SEM). Under SEM, D =  $0.51 \pm 0.06 \mu\text{m}$ , H =  $0.36 \pm 0.04 \mu\text{m}$ , D/H =  $1.44 \pm 0.30$ , Gs  
721 =  $0.26 \pm 0.04 \mu\text{m}$ , Ss =  $1.27 \pm 0.16 \mu\text{m}$ , Gs/Ss =  $0.21 \pm 0.05$ .

722 Habitat: humid slopes, hills, terraces, roadsides, riverbanks; 100-2700 m.

### 723 **33. *Artemisia campestris* (Table 1, Figs. 13c, 15)**

724 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
725 Apertures tricolporate. The exine near the colpi gradually thinned. P =  $21.69 \pm 0.85 \mu\text{m}$ , E =  $21.26 \pm 0.89 \mu\text{m}$ ,  
726 P/E =  $1.02 \pm 0.07$ , T =  $3.68 \pm 0.33 \mu\text{m}$ , L =  $21.21 \pm 0.89 \mu\text{m}$ , T/L =  $0.17 \pm 0.02$ . The exine ornamentation is

727 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.57 \pm 0.09 \mu\text{m}$ ,  $H = 0.38 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.53 \pm 0.23$ ,  $G_s$   
728  $= 0.41 \pm 0.09 \mu\text{m}$ ,  $S_s = 1.23 \pm 0.19 \mu\text{m}$ ,  $G_s/S_s = 0.34 \pm 0.08$ .

729 Habitat: steppes, waste areas, rocky slopes, dune margins; 300-3100 m.

730 **34. *Kaschgaria brachanthemoides* (Table 1, Figs. 14a, 15)**

731 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.  
732 Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 23.26 \pm 1.44 \mu\text{m}$ ,  $E = 22.09 \pm 1.18 \mu\text{m}$ ,  
733  $P/E = 1.06 \pm 0.08$ ,  $T = 3.93 \pm 0.44 \mu\text{m}$ ,  $L = 21.01 \pm 1.28 \mu\text{m}$ ,  $T/L = 0.19 \pm 0.02$ . The exine ornamentation is  
734 psilate (LM), spinulate (SEM). Under SEM,  $D = 0.55 \pm 0.07 \mu\text{m}$ ,  $H = 0.44 \pm 0.05 \mu\text{m}$ ,  $D/H = 1.25 \pm 0.20$ ,  $G_s$   
735  $= 0 \mu\text{m}$ ,  $S_s = 1.75 \pm 0.20 \mu\text{m}$ ,  $G_s/S_s = 0$ , Pertorations spacing ( $P_s$ )  $= 0.47 \pm 0.14 \mu\text{m}$ .

736 Habitat: dry mountain valleys, old dry riverbeds; 1000-1500 m.

737 **35. *Ajania pallasiana* (Table 1, Figs. 14b, 15)**

738 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures  
739 tricolporate. The exine near the colpi gradually thinned.  $P = 35.16 \pm 2.68 \mu\text{m}$ ,  $E = 35.92 \pm 3.31 \mu\text{m}$ ,  $P/E = 0.98$   
740  $\pm 0.03$ ,  $T = 10.23 \pm 0.85 \mu\text{m}$ ,  $L = 38.31 \pm 2.06 \mu\text{m}$ ,  $T/L = 0.27 \pm 0.03 \mu\text{m}$ . The exine ornamentation spinose.  
741 Under SEM,  $D = 4.41 \pm 0.35 \mu\text{m}$ ,  $H = 3.47 \pm 0.38 \mu\text{m}$ ,  $D/H = 1.29 \pm 0.21$ ,  $G_s = 0 \mu\text{m}$ ,  $S_s = 7.84 \pm 1.25 \mu\text{m}$ ,  
742  $G_s/S_s = 0$ ,  $P_s = 0.39 \pm 0.12 \mu\text{m}$ .

743 Habitat: thickets, mountain slopes, 200-2900 m.

744 **36. *Chrysanthemum indicum* (Table 1, Figs. 14c, 15)**

745 Pollen grains prolate or spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar  
746 view. Apertures tricolporate. The exine near the colpi gradually thinned.  $P = 33.54 \pm 1.71 \mu\text{m}$ ,  $E = 34.42 \pm$   
747  $2.46 \mu\text{m}$ ,  $P/E = 0.98 \pm 0.08$ ,  $T = 8.65 \pm 0.89 \mu\text{m}$ ,  $L = 34.82 \pm 1.65 \mu\text{m}$ ,  $T/L = 0.25 \pm 0.02$ . The exine  
748 ornamentation spinose. Under SEM,  $D = 2.94 \pm 0.33 \mu\text{m}$ ,  $H = 3.59 \pm 0.29 \mu\text{m}$ ,  $D/H = 0.82 \pm 0.10$ ,  $G_s = 0 \mu\text{m}$ ,  
749  $S_s = 7.11 \pm 0.76 \mu\text{m}$ ,  $G_s/S_s = 0$ ,  $P_s = 0.37 \pm 0.13 \mu\text{m}$ .

750 Habitat: grasslands on mountain slopes, thickets, wet places by rivers, fields, roadsides, saline places by  
751 seashores, under shrubs, 100-2900 m.

762

763 **Author contributions.** YFW, YFY, TGG conceived the ideas, LLL, BHJ, KQL, and BS collected the  
764 literature, LLL extracted and compiled the data, LLL, FQ, and BHJ made the statistical analysis, GX and ML  
765 collected pictures, LLL, KQL, and BS drew the figures and tables, LLL, YFW, YFY, LJF, FQ, and GX wrote  
766 the first draft of this manuscript, DKF corrected the various versions of the manuscript, while all authors  
767 contributed substantially to revisions.

768 **Competing interests.** The authors declare that they have no conflict of interest.

769 **Acknowledgments.** We thank Dr. Jian Yang, Institute of Botany, Chinese Academy of Sciences, for his kind  
770 help in drafting graphics. We appreciate Chen Chen from Institute of Botany, Chinese Academy of Sciences,  
771 Ji-Ye Zheng from No. 1 Middle School of Jiyang Shandong, and Jia-Hao Shen from Institute of Botany,  
772 Jiangsu Province and Chinese Academy of Sciences ([Nanjing Botanical Garden Mem. Sun Yat-Sen](#)), for their  
773 enthusiastic assistance in providing habitat photographs.

774 **Financial support.** This research was supported by the Strategic Priority Research Program of the Chinese  
775 Academy of Sciences (No. XDB26000000), National Natural Science Foundation of China (Nos. 31970223,  
776 32070240, and 42077416), and the Chinese Academy of Sciences President's International Fellowship  
777 Initiative (No. 2018VBA0016).
