CABLE SYSTEM

TECHNICAL PRODUCT DATA

An innovative approach to cable system design combined with proven engineering expertise, professional project management and specialist cable handling and tensioning expertise has positioned Teufelberger-Redaelli – formerly well known in this market as Redaelli – to successfully deliver a variety of cable solutions to worldwide tensile structures.

Teufelberger-Redaelli's comprehensive range of structural cable systems have been developed and optimised over many years to meet the challenging and increasingly sophisticated demands of the tensile structure construction industry.

Within this publication there is access to technical data from Teufelberger-Redaelli's range of standard carbon steel, stainless steel and HDPE coated cable options with all the relevant information to support your cable system design. There is also a comprehensive range of socket anchorage options to suit a wide variety of structure constraints and site conditions. When cable and socket selection has been made, Teufelberger-Redaelli can also provide digital CAD models of the socket anchorages to assist with your design process.

Teufelberger-Redaelli's team of experienced Engineers provides the necessary engineering resource to provide a complete package approach. From up front design assist help and advice, to construction engineering, through to site installation and tensioning to inspection and maintenance services, you have the peace of mind knowing that Teufelberger-Redaelli can provide a holistic approach to link all these crucial activities together under one package.

Cable supported tensile structure applications include the 550 feet tall Las Vegas High Roller Observation Wheel, the Miami Dolphins Hard Rock Stadium, the BC Place Stadium Vancouver, major FIFA/UEFA Soccer world cup stadia and Olympic stadia.

Teufelberger-Redaelli tensile cable systems are also applied to solve complex challenges of long span bridges including the Storebælt East Bridge, Tana Bru, Dalsfjord Suspension Bridge and can also provide creation and aesthetic solutions for pedestrian/cycle bridges including the Dubai Canal Footbridges and the Scioto River Footbridge in Ohio USA.

Complex cable nets for large facades e.g. The Shed Cultural Center in New York and bracing for iconic historical structures including the Leaning Tower of Pisa are other special structures where Teufelberger-Redaelli cables provide the structural solution.

All Teufelberger-Redaelli structural cable systems are supplied in accordance with current Euro Codes also they are compliant with international standards including ASTM and American Society of Civil Engineer (ASCE). In addiction Redaelli cables also carry the reassurance of CIT and European Technical Approvals ETA-18/1122. The annual updated list of certifications is available at the link https://www.redaelli.com/company/governance/accreditations

INDEX

RANGE OF APPLICATIONS

Teufelberger-Redaelli's cable system is used in a wide range of structural applications.

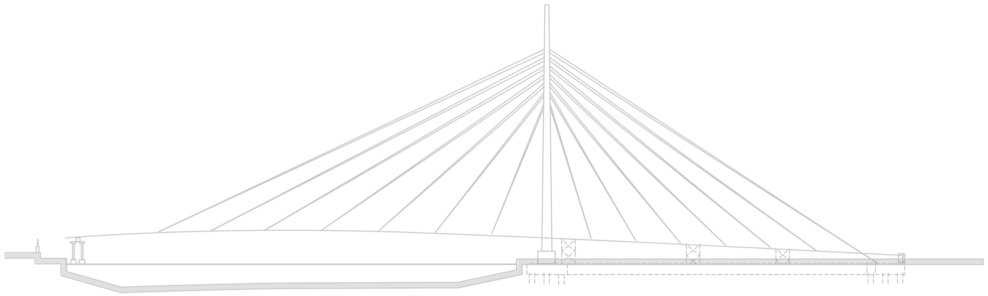
SUSPENSION BRIDGES

- Full Locked Coil ropes as main cables and hangers
- Open Spiral Strands as hangers, catwalk cables

RANGE OF APPLICATIONS

Teufelberger-Redaelli's cable system is used in a wide range of structural applications.

CABLE-STAYED BRIDGES



- Full Locked Coil ropes as stay cables
- Open Spiral Strands as stay cables

RANGE OF APPLICATIONS

Teufelberger-Redaelli's cable system is used in a wide range of structural applications.

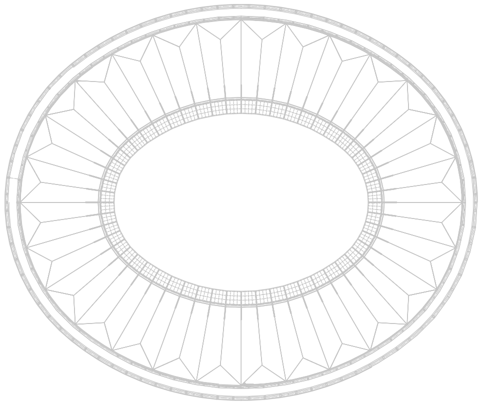
TIED ARCH BRIDGES

- Full Locked Coil ropes as hanger cables
- Open Spiral Strands as hanger cables

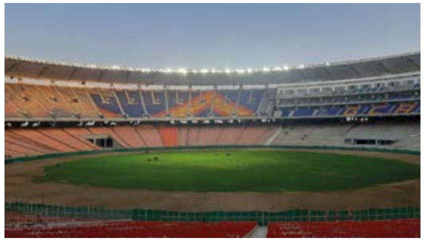
RANGE OF APPLICATIONS

Teufelberger-Redaelli's cable system is used in a wide range of structural applications.

ROOF STRUCTURES



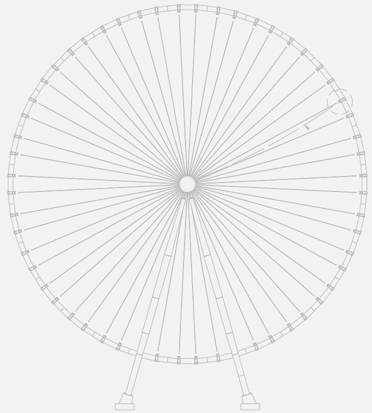
- Full Locked Coil ropes as tension ring and radial cables, edge cables, valley cables, hangers and stay cables
- Open Spiral Strands as radial cables, edge cables, valley cables, hangers and stay cables



RANGE OF APPLICATIONS

Teufelberger-Redaelli's cable system is used in a wide range of structural applications.

OBSERVATION WHEELS

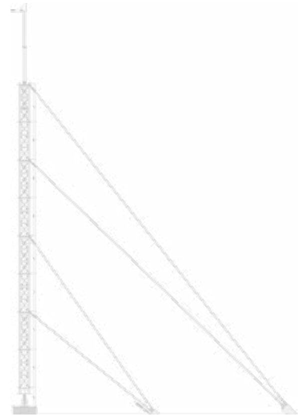


- Full Locked Coil ropes as spoke cables and stay cables, rotational spoke cables and tieback cables
- Open Spiral Strands as hangers, catwalk cables

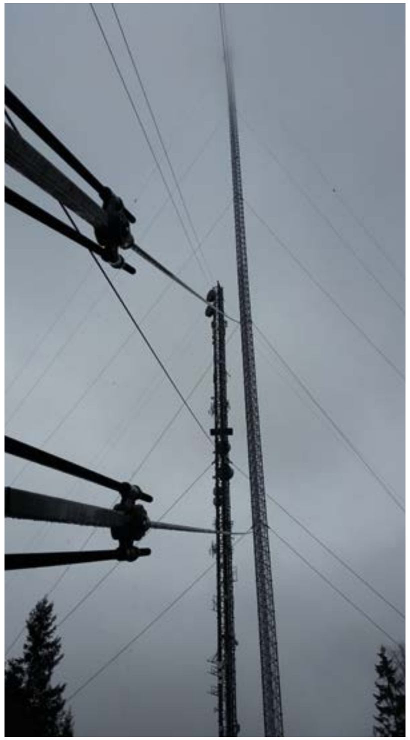
RANGE OF APPLICATIONS

Teufelberger-Redaelli's cable system is used in a wide range of structural applications.

STAYED MASTS AND TOWERS



- Full Locked Coil ropes as stay cables
- Open Spiral Strands as stay cables

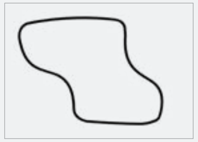


FULL LOCKED COIL ROPES

Teufelberger-Redaelli Full Locked Coil (FLC) ropes are manufactured using a combination of helically wound, hot-dip galvanised, high strength steel round wires and interlocking Z-shaped wires. The outer layers of Z-shaped wires are generally spun in opposite directions around a central core of round wires. Each individual wire is tested and verified for tensile strength, ductility, elongation at fracture, bending, torsional properties and adhesion of zinc coating in accordance with EN 10264 and EN 12385-10. Main properties: excellent axial stiffness, optimum strength to weight ratio, excellent fatigue resistance, torque balanced, excellent resistance to lateral forces meaning most suitable for cable clamping.

"Z" SHAPED WIRES

Characteristics:
Rolled to required diameter
Minimum Tensile Strength Grade IPS (228 ksi)



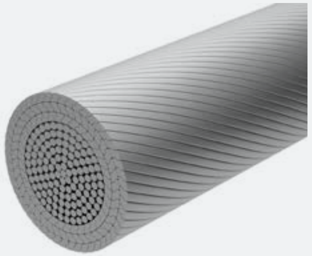
4-Stages Corrosion protection system:

- Locking of the cable's external surface due to closed configuration of Z-shaped wires
- Zinc (Zn) and Zinc Aluminium (95% Zn / 5% Al) hot dip coating of individual wires
- Internal zinc rich corrosion inhibitor compound applied during the cable stranding process
- Vacuum extruded or co-extruded High Density Polyethylene (HDPE) sheathing-optional
- Additional site applied surface corrosion protection system using Tensocoat-optional

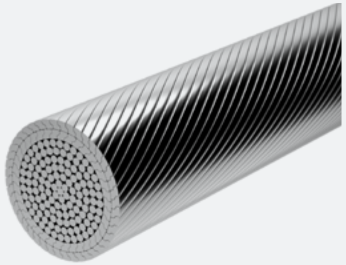
Reference standards for FLC cable design: EN 12385-10, EN 1993-1-8, EN 1993-1-9, EN 1993-1-11.

3 different cables construction:

FULL LOCKED COIL ROPE
HIGH STRENGTH STEEL (FLC)



FULL LOCKED COIL ROPE
STAINLESS STEEL (FLX)



FULL LOCKED COIL ROPE WITH HDPE
(FLCH)

Each strand master batch is sample tested to validate the minimum breaking force according to EN 12385-1.
Additional tests are optional to verify other cable properties including:

- Fatigue test
- Long-term creep test
- Clamp slippage friction test
- Fire resistance test

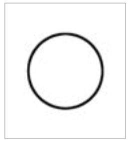
Teufelberger-Redaelli has developed a large data bank of such cable test results across a full range of several diameters.
Customised cable designs are also available to suit customer project specific requirements and specifications.
For all other corrosion protection systems we ask you to refer to the cable system data sheets, where the technical specification are reported in detail.

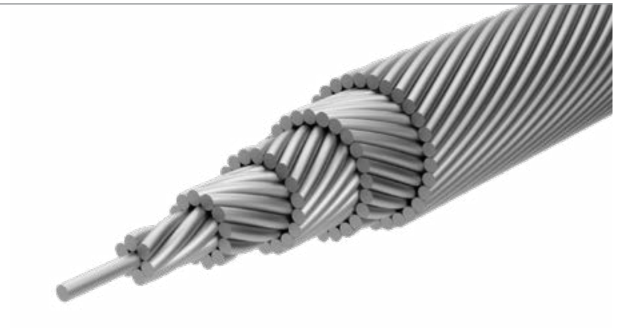
OPEN SPIRAL STRAND

Teufelberger-Redaelli Open Spiral Strands (OSS) are manufactured using helically wound, hot-dip galvanised high strength steel round wires which are generally spun in opposite directions around a central core. Each individual wire is tested and verified for tensile strength, ductility, elongation at fracture, bending, torsional properties and adhesion of zinc coating in accordance with EN 10264 and EN 12385-10.
Main properties: high axial stiffness, high strength to weight ratio, high fatigue resistance, torque balanced.

ROUND WIRES

Characteristics:
Drawn to required diameter (typically 0.2in)
Minimum Tensile Strength Grade IPS (228 ksi)





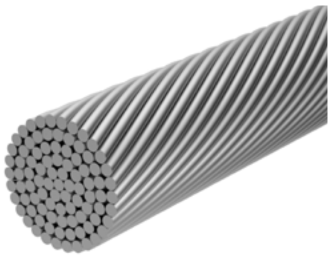
3-Stages Corrosion protection system:

- Zinc (Zn) and Zinc Aluminium (95% Zn / 5% Al) hot dip coating of individual wires
- Internal zinc rich corrosion inhibitor compound applied during the cable stranding process
- Vacuum extruded or co-extruded High Density Polyethylene (HDPE) sheathing-optional
- Additional site applied surface corrosion protection system using Tensocoat-optional

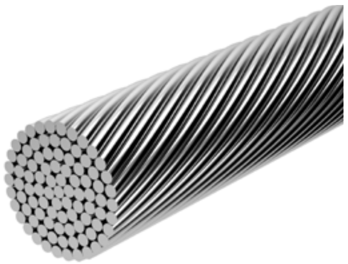
Reference standards for OSS cable design: EN 12385-10, EN 1993-1-8, EN 1993-1-9, EN 1993-1-11.

3 different cables construction:

OPEN SPIRAL STRAND
HIGH STRENGTH STEEL (OSS)



OPEN SPIRAL STRAND STAINLESS STEEL
(OSX)



OPEN SPIRAL STRAND WITH HDPE
(OSSH)

Each strand master batch is sample tested to validate the minimum breaking force according to EN 12385-1.
Additional tests are optional to verify other cable properties including:

- Fatigue test
- Long-term creep test
- Clamp slippage friction test
- Fire resistance test

Teufelberger-Redaelli has developed a large data bank of such cable test results across several diameters.
Bespoke cable designs are also available to suit customer project specific requirements and specifications.
For all other corrosion protection systems we ask you to refer to the cable system data sheets, where the technical specification are reported in detail.

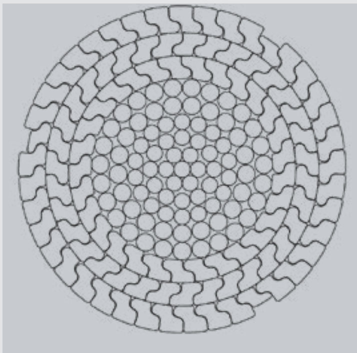
FLC WITH ANTI-VIBRATION GROOVES

Given their main characteristics (small cross section, small mass and lack of bending stiffness), cables are structural elements that can be sensitive to vibrations. Although there is a wide range of cables vibration mechanisms, they can be broadly grouped into those generated by wind and those related to the loading of the structure. Several countermeasures can be adopted to prevent wind induced cable vibrations.

Longer cables are more susceptible to vibrations, due to their larger wind exposure and lower damping values. Reference is made to EN 1993-1-11 for wind effects to be considered in design of structures with tension components.

Industry studies and experimental evidence suggest that the creation of water rivulets along cables length modify the apparent shape of cable's cross section and therefore potentially initiate vibration phenomena known as rain-wind-induced vibrations. Rain-wind-induced vibrations can reach significantly large amplitudes and cause long-term performance issues to the structure.

Surface modification of the cables is an effective countermeasure. Disrupting the rivulets by adding depressed wires on the cable shape is an effective way to reduce rain-wind vibrations.



CORROSION PROTECTION

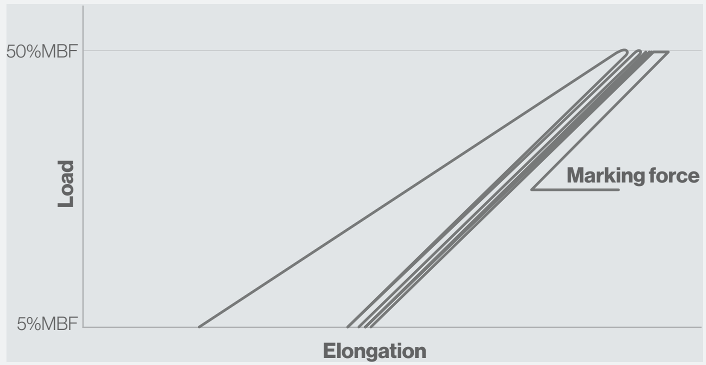
Long-term corrosion protection is ensured for each component part of the overall cable system. The end anchorages and clamps are carefully designed to avoid water traps in localised areas. Appropriate materials are used as corrosion protection of each element of the prefabricated cable.

PRE-STRETCHING, MEASURING AND MARKING

Cables are prestretched (prestressed) to remove the initial inelastic elongation inherent in the helical structure of the strand and to stabilize the strand modulus of elasticity.

The master length of strand is cyclically pulled with a force ranging from approx. 5% to 50-55% of the strand minimum breaking force for five or more times. After the last pre-stretching cycle, the strand is marked under preload: the axial force is lowered to the marking force for the individual cable lengths. The strand master length is then measured and marked for final cutting and for positioning of intermediate clamps, if required. The measurement method allows for the automatic compensation of the thermal elongation, and it is performed in monitored thermal condition.

PRE-STRETCHING CYCLES



The load cycles and pulling forces are automatically controlled and temperature is constantly monitored.

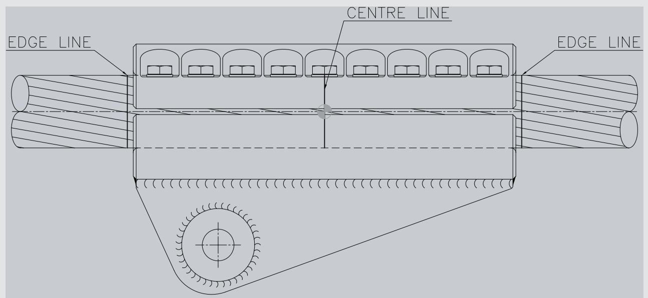
The standard individual cable assembly length tolerance (mm) after the pre-stretching, including the sockets is:

$$\pm\left(\sqrt{L[\mathrm{m}]}+5\right)[mm]$$

L is the length of the individual cable assembly in metres. The accuracy of the cable length can be changed according to Client's specific requirements.

Cable marking lengths consider the following effects to reduce manufacturing tolerances:

- Reference temperature during marking relative to temperature used in static calculation.
- Expected long-term creep of the cable.
- Setting of the pouring cone of the socket.



SOCKETING

Cables are terminated to the sockets by means of three possible methods:

- Spelter socketing by polyester resin for structural use with minimum 100% efficiency to the strand minimum breaking force. In accordance with EN 13411-4.
- Spelter socketing by poured hot zinc or zinc alloy with minimum 100% efficiency to the strand minimum breaking force. In accordance with EN 13411-4.
- Swaged (pressed) socketing with minimum 90% efficiency to the strand minimum breaking force. In accordance with EN 13411-8.

Spelter socketing involves the following manufacturing operations:

1. The wires at the strand end are opened to form a "brush".
2. The brush is ultrasonically cleaned.
3. The brush is positioned inside the internal cone profile of the socket.
4. Structural polyester resin or zinc / zinc alloy is poured into the socket wires to form a socket cone.
5. The solid cone that is created transfers the load between cable and socket.

There are no mechanical wedges, grips, serrations or connections used in the socketing process, meaning there is no mechanical damaging of the wires within the strands at this safety critical area.

Whilst the structural efficiency of resin and zinc / zinc alloy socketing is the same, there are some differences to be considered in the selection of the preferred method:

- Resin is cold process and zinc / zinc alloy is a molten hot metal pour, meaning pouring resin is inherently safer than pouring zinc / zinc alloy.
- Resin is more efficient to produce because of the relative curing time compared to zinc / zinc alloy.
- Zinc / zinc alloy is poured at a temperature of approximately 840 °F, therefore sockets must be pre-heated before socketing operations begin.
- Where there is a requirement for painted sockets, pre-heating the sockets is not possible, therefore resin socketing is the only available choice.
- Resin is recommended for HDPE sheathed cables because of the high temperatures of the poured zinc / zinc alloy can melt and damage the polyethylene.

Socketing by swaging is performed by pressing the section of sockets with the cable termination inside. This method reduces the cable system's resistance by 10% of strand minimum breaking force.

All sockets connections are designed to have a breaking force higher than that of the respective strand.

CABLE ELONGATION INFORMATION

Cables have to be axially loaded in order to measure their executive length. In their unloaded condition, cables have a non-linear load / elongation behaviour.

There are several contributions to cable elongation:

- Initial non elastic elongation: elongation due to the bedding down of wires in a new cable loaded for the first time (related to the cable construction). Non elastic elongation is removed after pre-stretching.
- Elastic Elongation: where cables extend approximately in line with Hookes Law (stress is proportional to strain) until the Elastic Limit is reached. Modulus of Elasticity is stabilised after pre-stretching.

$$\Delta l_e = \frac{\Delta N}{EA} \cdot L$$

Where ΔN = load increase (kip)
L = cable length (in)
E = cable elastic modulus (ksi)
A = metallic cross section (in^2)
Δl_e = elastic elongation (in)

- Creep Elongation: this is a continued and irreversible extension of cables when subjected to constant, long-term static loading (related to material properties and load). Cable creep takes place during a time that depends on different factors (e.g. the level of loading, the number of loads, ambient temperature, temperature swing). During erection, it may be necessary to load cables to a higher initial load to compensate for on-going and future cable creep.
- Thermal Elongation and Contraction: the change of a length *L* (mm) of cable produced by a temperature change.

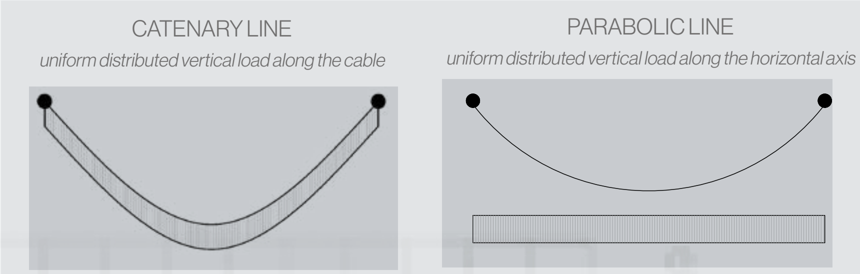
$$\Delta l_t = \alpha \cdot \Delta t \cdot L$$

Where α = coefficient of linear thermal expansion (°F^{-1})
Δt = temperature change (°F)
L = cable length (in)

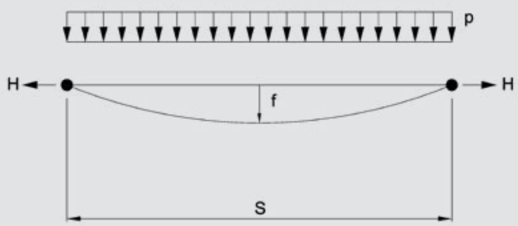
α = 6.67 x 10-6 for °F for steel wires
α = 8.89 x 10-6 for °F for stainless steel wires

CABLE CATENARY LENGTH CALCULATION

Cables can adapt to different geometric configuration if correctly loaded as they automatically follow the force distribution (form active shape).



The catenary shape of a uniform cable hanging under its self-weight between two supports is studied considering a homogeneous and flexible element bearing a uniformly distributed load. If the profile is flat (f/L<1/8) the catenary length of the cable can be calculated using the simplified approach:

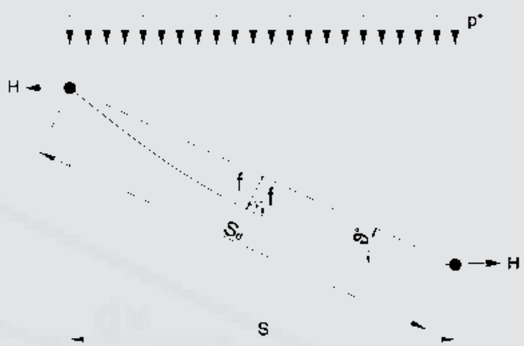


$$H = \frac{ps^2}{8f}$$

The resulting formula is:

$$l = s\left[1 + \frac{8}{3}\left(\frac{f}{s}\right)^2\right]$$

Where *l* is the cable length



$$H = \frac{p^* s^2}{8f}$$

The resulting formula is:

$$l = s_d\left[1 + \frac{8}{3}\left(\frac{f_\perp}{s_d}\right)^2\right]$$

$$s = s_d \cos\vartheta$$

$$f_\perp = f \cos\vartheta$$

Where *l* is the cable length

CABLE LABORATORY TESTING

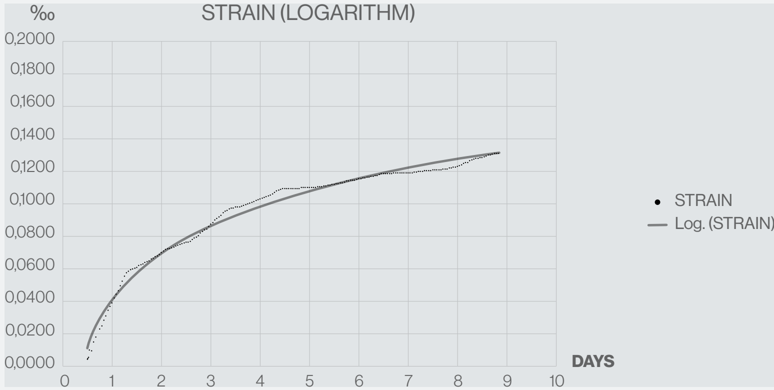
Teufelberger-Redaelli has a comprehensive database of tests performed on different cable system arrangements and cable diameters. Each manufactured cable is tested to validate the minimum breaking force and the modulus of elasticity according to EN 12385-1 (E+R test). Additional tests can verify other cable properties. Teufelberger-Redaelli has established strong relationships with testing laboratories, both national and international, where minimum breaking force tests can be performed. Where required, third part test certification can be supplied.

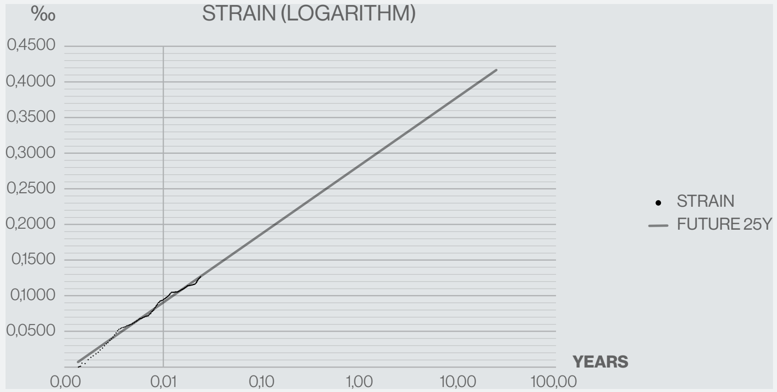
Tensile and modulus test (E+R test)

E+R tests are performed to measure cable's modulus of elasticity (E) and actual breaking force (ABF) according to EN12385-1. A cable sample is taken from the master length production batch and fitted with laboratory sockets or sockets equivalent to the permanent ones. The elongation of the cable is measured by means of an extensometer installed in the middle of the specimen. Position transducers may also be located at sockets edge to evaluate the cone setting. Other geometric characteristics (cable diameter, socket geometry, ecc.) are measured as well.

Long-Term Test

Long-term tests are performed in order to define the actual creep coefficient and long-term behaviour of the cable system. Again a cable sample is taken from the master length production batch and fitted with laboratory sockets or sockets equivalent to the permanent ones. The elongation of the cable is measured by means of an extensometer installed in the middle of the specimen. After the pre-stretching cycles, which are performed to remove the initial inelastic deformation, a load approximately equal to 40% of the strand minimum breaking force is kept constant throughout the test, for minimum 200 hours. The test is completed when the partial elongation between two consecutive readings is stabilised.





The results obtained from long-term tests are processed to obtain the logarithmic function simulating the creep development after 5 or 10 years. (200 h).

Cable Fatigue Test

Fatigue tests are performed to verify the effective durability behaviour of the cable system, generally by means of a tension – tension fatigue test. As fatigue failure usually occurs adjacent to the socket anchorages, the cable test sample is usually fitted with permanent sockets, reproducing the actual flexural effects or traverse stresses that the cable will see in service. The specimen is installed into a tensile test machine which applies cyclic loads according to relevant test specifications.

Fatigue tests are usually executed to comply with the requirements of EN 1993-1-11 and typically include the following pass / fail criteria:

- Number of the broken wires after 2,000,000 cycles should be less than 2% of the total.
- No failure in the socketing material or in any component of the socket anchorage.
- The sample should be capable to generate a minimum breaking force equal to 92% of the strand Actual Breaking Force or 95% of the strand minimum breaking force – whichever is greater.

Type of test	Fatigue loading before fracture test
Axial test (class 3 and 4 according to EN 1993-1-11)	$\sigma sup = 0{,}45\ \sigma uk$ $\Delta\sigma$ according to $\Delta\sigma c$ in the following Table $\Delta\alpha = 0$ $n = 2x10^6$ cycles
Axial and Flexural test (class 5 according to EN 1993-1-11)	$\sigma sup = 0{,}45\ \sigma uk$ $\Delta\sigma$ according to $\Delta\sigma c$ in the following Table $\Delta\alpha = 0 – 10$ milli radians (0 – 0,7 degrees) $N = 2 \times 10^6$ cycles

Group		Tension components	Detail category $\Delta\sigma c$ (N/mm^2)
B	2	Full locked coil ropes with metal or resin socketing	150
	3	Spiral strands with metal or resin socketing	150

Cable Clamp Slippage Test

Slippage tests determine the exact value of slippage force on ring cable connector, radial cable clamps or similar components. Clamps and bolts equal to permanent ones are installed on cable specimen, following the agreed installation procedure and bolts are tensioned in sequence.

The cable sample should have the same characteristics as the cables delivered to site. The actual installation method for the clamps should also be accurately simulated within the laboratory. Bolts can be instrumented to monitor the actual tightening force during tests.

Fire Resistance Test

Fire resistance tests are useful to analyse cables and sockets resistance under fire conditions with different socketing materials (i.e. polyester resin and zinc / zinc alloy) and to identify the most critical structural details under a constant load. The tests are performed on cables and their terminations under a heavy thermal transient simulating a fire scenario. The fire load could be identified, for instance, by the curve ISO 834 which is normally used for civil applications.

The curve that represents the gradient of the air temperature during the burning process is analytically:

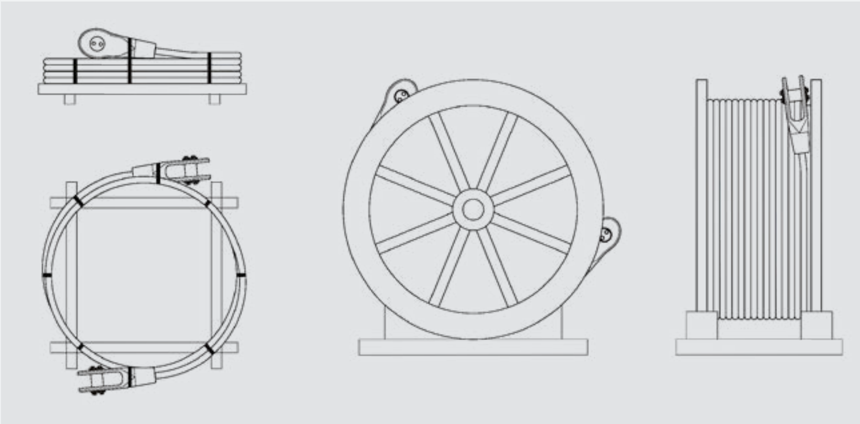
- $T = T_o + 345 * Log_{10}(8xT_m + 1)$
- T_0 environment temperature at the starting point
- T_m time duration in min

Time to failure is determined for different types of sockets materials and compared with the time to failure of the cable.

DELIVERY AND PACKAGING

Teufelberger-Redaelli cables are delivered as a prefabricated system, which enables a simple, rapid cable installation and tensioning process. Cables are delivered to site in coils or reels, either made of steel or wood, protected to prevent mechanical damage and contamination from external elements such as dust or sand during transportation.

Teufelberger-Redaelli's technical department, as standard procedure, develops for each project a loading and unloading manual, which includes the precautions that should be taken during cable handling. Sockets ancillaries and accessories are delivered in pallets or crates.



QUALITY CERTIFICATION

Teufelberger-Redaelli has implemented and operates an audited quality system in accordance with ISO 9001. This certification ensures continued compliance with contractual specifications and all relevant standards for the product. It also enables continuous monitoring and improvement of the effectiveness and the efficiency of the cable production processes and company's organisation. Internal processes and procedures are constantly updated to integrate all technological and organisational actions which aim to reduce and eradicate product non-conformities,waste, delays and remedial works.

Teufelberger-Redaelli's design and production process is monitored and documented throughout each project, assuring full traceability of each component within the cable system. In accordance with ISO standards, external suppliers are constantly evaluated, qualified audited and carefully controlled. Material and product quality is checked at suppliers premises and upon delivery at Teufelberger-Redaelli factories. These controls are executed by trained and qualified Teufelberger-Redaelli personnel, with the support of external and third party inspectors and Certification Bodies. Each step of the production process can be inspected upon request by our Clients or their representative. Cables and material properties are continuously tested in external laboratories with relevant accreditation. For every Teufelberger-Redaelli cable supplied a Quality Certification Book is issued, including all quality certificates to verify each component's material properties and production including NDT tests.

Teufelberger-Redaelli operates an Environmental Management System covering all factories and warehouses which is certified in accordance with ISO 14001.

Redaelli also has certified National and European Technical approvals. The full list of updated certification is available on our website.

HIGH PERFORMANCE STEEL CABLE SYSTEM

TECHNICAL PRODUCT DATA

HIGH PERFORMANCE STEEL CABLE SYSTEM

Teufelberger-Redaelli's exacting standards and attention to detail, combined with the highest quality controls and materials, means you can be assured your Teufelberger-Redaelli cable system will perform in your safety critical tensile structure application.

The cable system, prefabricated in the factory using the highest quality cable, sockets, socketing and finishing, will fulfil the design and installation needs of your project. Our range of high performance steel cables can be either supplied using Full Locked Coil (FLC) ropes or Open Spiral Strands (OSS). Both solutions are available with poured spelter cone type sockets (resin or zinc filled) or with pressed swaged sockets depending on the cable diameter and the project requirements and specifications. Each socket is made using high strength steels and can be chosen from a wide range of socket shape options, the majority of which are available in either a fixed or length adjustable configuration to meet the design and architectural requirements. In case of special architectural structural requirements, sockets can be customised in relation to degree of length adjustment, resistance, structural interface.

Teufelberger-Redaelli can draw upon more than 430 years of combined experience in this highly specialised market and is confirmed by succeeding on some of the most challenging civil engineering and construction projects in the world. Teufelberger-Redaelli's specialist Production Dept. and equipment control, pre-stretch and assemble the component parts to supply a high quality prefabricated cable systems ready to be installed on site. No additional manufacturing operations are needed on site.

d	Nominal Diameter
F_{uk}	Characteristic Breaking Strength
F_{Rd}	Design Resistance
A	Metallic Cross Section
EA	Elastic Stiffness

(1) Characteristic Breaking Strength F_{uk} = Minimum Breaking Force F_{min} x Loss Factor ke (ke = 1) where ke = 1 for metal/resin filled socket, ke = 0.9 for swaged socket
(2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$
Upon request, we can propose alternative cable diameters and cable characteristics.

d_{max} Max Strand Diameter

N_{uk} Characteristic Breaking Strength

N_{Rd} Design Resistance

D_{HOLE} Hole Diameter

S_{max} Considering $T = T_{max}$

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$

For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max} Max Strand Diameter

N_{uk} Characteristic Breaking Strength

N_{Rd} Design Resistance

D_{HOLE} Hole Diameter

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$

For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max}	Max Strand Diameter
N_{uk}	Characteristic Breaking Strength
N_{Rd}	Design Resistance
D_{HOLE}	Hole Diameter
Adj.	Adjustment

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max}	Max Strand Diameter
N_{uk}	Characteristic Breaking Strength
N_{Rd}	Design Resistance
D_{HOLE}	Hole Diameter
Adj.	Adjustment

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$

For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

- d_{max} — Max Strand Diameter
- N_{uk} — Characteristic Breaking Strength
- N_{Rd} — Design Resistance
- D_{HOLE} — Hole Diameter
- Adj. — Adjustment

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / Y_R$ $F_{Rd} = N_{Rd}$
For European Standard EN 1993-1-11: $Y_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

- d_{max} — Max Strand Diameter
- N_{uk} — Characteristic Breaking Strength
- N_{Rd} — Design Resistance
- D_{HOLE} — Hole Diameter
- Mass — Mass Without Threaded Rod

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

(2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
Hexagonal nut for M ≤ 80 mm

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max}	Max Strand Diameter
N_{uk}	Characteristic Breaking Strength
N_{Rd}	Design Resistance
D_{HOLE}	Hole Diameter
Mass	Mass Without Threaded Rod

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

(2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
Hexagonal nut for M ≤ 80 mm

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

ADJUSTABLE CYLINDRICAL SOCKET WITH THREADED ROD, BUSH, SPHERICAL NUT AND WASHER

d_{max}	Max Strand Diameter
N_{uk}	Characteristic Breaking Strength
N_{Rd}	Design Resistance
D_{HOLE}	Hole Diameter
Mass	Mass Without Threaded Rod

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

(2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
Hexagonal nut for M ≤ 80 mm

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max} Max Strand Diameter

N_{uk} Characteristic Breaking Strength

N_{Rd} Design Resistance

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max} Max Strand Diameter

N_{uk} Characteristic Breaking Strength

N_{Rd} Design Resistance

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

CORROSION PROTECTION

Galvanised Wires
Round and Z-shaped wires comply with the requirements of EN 10264-2 and EN 10264-3 Class A.

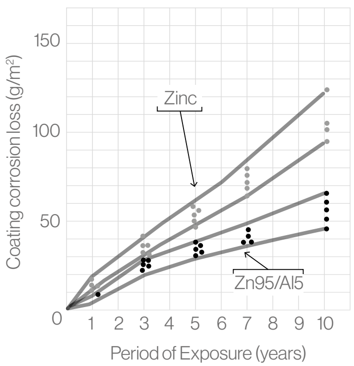
DIAMETER OF ROUND WIRES	MINIMUM AREA MASS OF COATING
0,4-7 mm	85-300 g/m²

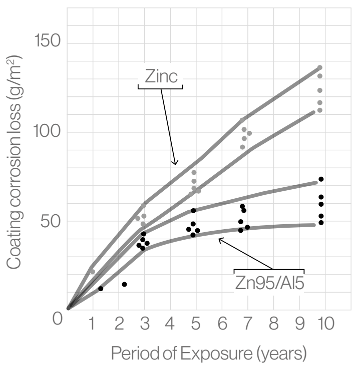
HEIGHT OF Z-WIRES	MINIMUM AREA MASS OF COATING
2-8 mm	215-300 g/m²

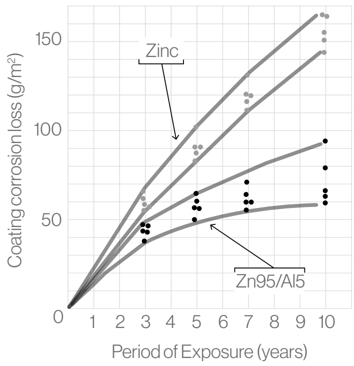
The hot dip galvanising process ensures a zinc layer is firmly alloyed and chemically bonded with the underlying steel wire. The zinc coating isolates the wires from the external corrosive agents and acts as sacrificial material when in contact with air. The adherence of zinc coating on wires is tested in accordance with EN 12385-10.

Zinc-Aluminium Coated Wires
A layer of Zn95/Al5 coating is applied to the outer layers of wires. The passive corrosion inhibition of the aluminium oxidation significantly improves the overall corrosion protection of zinc. When zinc is exposed to oxygen and water it acts as anodic material which is initially sacrificed. The aluminium content then reacts with the external elements and forms an aluminium oxide, which creates a protective layer across the wire surface. The aluminium oxide is stable and creates an effective passive barrier protection.

Exposure tests in different environments prove the reduced rate of corrosion of Zn95/Al5 coated wires compared to galvanised wires.







Round and shaped wires are coated with a minimum thickness of Zn95/Al5 coating of 300 g/m².

The adherence of the coating on wires is tested in accordance with EN 12385-10.

Internal Cables Corrosion Protection
OSS and FLC cables are internally filled with Tensofill which prevents the entry and diffusion of moisture inside the cable and provides additional protection to the galvanised wires. Tensofill is a compound made up as a Severe Atmospheric Corrosion Inhibitor and Zinc powder in an optimised quantity to obtain the best performance in terms of corrosion resistance.

Tensofill has the following properties:
- Brookfield Viscosity (A4V 20 RPM): 10000 cps
- Specific weight: 1.27 kg/dm³
- Resistance to salt fog (ASTM B117): 500 hours
- Resistance to humid state: 500 hours

Surface Corrosion Protection on Cables and Sockets
External corrosion protection Tensocoat wax can be applied on cables and sockets after installation and tensioning of cables as an additional stage corrosion protection barrier. Tensocoat is a compound made up as a Severe Atmosphere Corrosion Inhibitor with Resin. It combines anticorrosive, waterproof and reflective properties within its constituents. The product is highly flexible and suitable to seal the wire interstices. Tensocoat is available in light aluminium metallic grey (aluminium micro-flakes) or matt white (titanium micro-flakes).

Tensocoat Wax has the following properties:
- Specific mass: 1.0 kg/dm³
- Dry mass: 56%
- Resin (on dry mass): 25 %

Tensocoat is applied using single brush strokes after cleaning the area to be protected. The product can be removed and re-applied for inspection purposes.

SOCKETS

	MATERIAL	CORROSION PROTECTION	NDT EXAMINATION
Fix Fork Socket TTF Adjustable Fork Socket TBF Socket Body for Bridge Socket BRC	High strength steel casting G24 Mn6 (EN 10340), BT1 (BS 3100) or G18 NiMoCr3-6 (EN 10340) quenched and tempered	Hot dip galvanising with minimum 85 µm thickness (EN 1461)	• Ultrasonic Test (EN 12680-1) • Magnetoscopic Test (EN 1369) • Visual Inspection (EN 1370) • Dimensional Control (ISO 8062-3) • Radiographic Examination (EN 12681) upon request
Socket body for TBF Cylindrical sockets type CYF, CYS, CYT, CYN, CYW, CYB, CYR, CYV, CYM, CYC and CYA Pin for TTF socket, TBF socket Pin for BRC socket Pin for MAC, MAC-R, TBC, MCC swaged socket Bush for CYB, CYR Nuts for CYT, CYN, CYW	High strength alloy steel CrNiMo (EN ISO 683), rolled or forged, quenched and tempered.	Hot dip galvanising with minimum 85 µm thickness (EN 1461)	• Ultrasonic Test (EN 10308) • Dimensional Control (EN 22768-2 for machining, ISO 965-1 for threads)
Threaded rods and nuts for sockets type CYB, CYR, CYV, CYM and BRC Coupler for sockets type TBF, CYC and CYA	High strength alloy steel 42CrMo4 (EN ISO 683), B7 (ASTM A193) or 2H (ASTM A194)	Hot dip galvanising with bright threads/ Geomet	• Ultrasonic Test (EN 10308) • Magnetoscopic Test (EN 10228-1) only on nuts • Visual Examination • Dimensional Control (EN 22768-2 for machining, ISO 965-1 for threads)
Lock plates for TTF/TBF socket pin Washers for CYW, CYR, CYV	S355J2 (EN 10025)	Hot dip galvanising with minimum 85 µm thickness (EN 1461)	
Swaged Sockets type MAC, MAC-R, MCC, TBC and FLT	42CrMo4 (EN ISO 683) or S355J2 (EN 10025)	Hot dip galvanising (centrifuged) with minimum 55 µm thickness (EN 1461)	• Ultrasonic Test (EN 10308) • Visual and Dimensional Inspection

HDPE CABLE SYSTEM

TECHNICAL PRODUCT DATA

HDPE

High Density Polyethylene (HDPE) can be applied to structural cables for improving corrosion protection, increasing visibility and for architectural, aesthetic reasons.

This option has an impact on the sockets choice which are specifically designed and manufactured to accommodate the additional HDPE layer within the socket neck.

OPEN SPIRAL STRAND HDPE

- d_{max} Max Strand Diameter
- N_{uk} Characteristic Breaking Strength
- N_{Rd} Design Resistance
- D_{HOLE} Hole Diameter

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

- d_{max} — Max Strand Diameter
- N_{uk} — Characteristic Breaking Strength
- N_{Rd} — Design Resistance
- D_{HOLE} — Hole Diameter
- Adj. — Adjustment

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$

For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

d_{max} Max Strand Diameter

N_{uk} Characteristic Breaking Strength

N_{Rd} Design Resistance

D_{HOLE} Hole Diameter

Mass Mass Without Threaded Rod

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$
For European Standard EN 1993-1-11: $\gamma_R = 1.0$

(2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$
Hexagonal nut for M ≤ 80 mm

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

ADJUSTABLE CYLINDRICAL SOCKET WITH THREADED ROD, SPHERICAL NUT AND WASHER

d_{max}	Max Strand Diameter
N_{uk}	Characteristic Breaking Strength
N_{Rd}	Design Resistance
D_{HOLE}	Hole Diameter
Adj.	Adjustment

(1) Characteristic Breaking Strength $F_{uk} = N_{uk}$ (2) Design Resistance $F_{Rd} = (F_{uk} / 1.5) / \gamma_R$ $F_{Rd} = N_{Rd}$

For European Standard EN 1993-1-11: $\gamma_R = 1.0$

Upon request, we can suggest the effective diameter and the breaking strength of the cable for the specific project.

HDPE TECHNICAL SHEET

High Density Polyethylene (HDPE) Coated Cables
For increasing long-term durability or high visibility OSS and FLC cables can be additionally protected with a vacuum extruded HDPE covering.

The HDPE is applied by a continuous extrusion process and is closely monitored under factory-controlled conditions.

This external plastic coating provides an additional corrosion protection stage on outer surface of the cables, assuring optimum durability for cables even in very aggressive environments.

This option also allows clients to benefit from more aesthetic choices in their cable selection with a large spectrum of RAL colours available extruded, co-extruded over a carbon black foundation HDPE layer, or a double coloured layer.

Additionally, it is also possible to extrude an axial line mark along the length of the cable.

HDPE MINIMUM REQUIRED CHARACTERISTICS		
TENSILE STRAIN AT BREAK	TENSILE STRENGTH	ESCR
Min. 400 %	Min. 2755psi	Min. 1000 h

HDPE relevant properties:

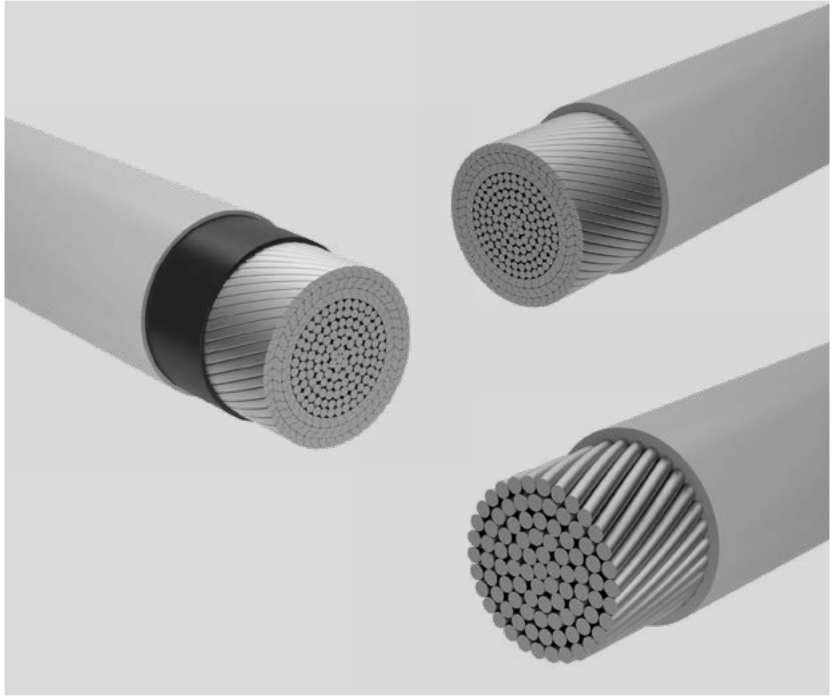
- Very low maintenance needed during the cable lifetime.
- UV stability against solar radiation.
- Weathering resistance.
- Full spectrum of outer layer final RAL colours.
- Typical HDPE wall thickness is 10% of the internal strand diameter.
- Cables are capable of being coiled on a diameter of 30 times cable diameter.

A critical area for HDPE sheathed cables is the interface at the socket neck. Teufelberger-Redaelli has engineered a technical solution to prevent water getting into the socket. The socket has been specially designed to create a water-tight joint which seals the entrance of the cable. This joint is suitable for all the sizes of sockets.

The water-tight joint offers several benefits:

- Connection between HDPE cover, cable and socket is secured from risk of water ingress.
- There is a mechanical locking mechanism on to the cable, ensuring firm fixing of the HDPE.
- No significant change from the original socket's geometry and primary steel connection dimensions.

Socketing option in this application is restricted to polyester resin for structural applications with minimum 100% efficiency to the strand minimum breaking force. In accordance with EN 13411-4 resin is recommended for HDPE sheathed cables instead of zinc / zinc alloy socketing due to the high temperatures involved with that process which can melt and damage the polyethylene.



SOCKETS

	MATERIAL	CORROSION PROTECTION	NDT EXAMINATION
Fix Fork Socket TTF Adjustable Fork Socket TBF Socket Body for Bridge Socket BRC	High strength steel casting G24 Mn6 (EN 10340), BT1 (BS 3100) or G18 NiMoCr3-6 (EN 10340) quenched and tempered	Hot dip galvanising with minimum 85 µm thickness (EN 1461)	• Ultrasonic Test (EN 12680-1) • Magnetoscopic Test (EN 1369) • Visual Inspection (EN 1370) • Dimensional Control (ISO 8062-3) • Radiographic Examination (EN 12681) upon request

STAINLESS STEEL CABLE SYSTEM

TECHNICAL PRODUCT DATA

STAINLESS STEEL CABLE SYSTEM

Stainless steel cable systems can be supplied up to 42mm diameter. with swaged sockets and larger diameters with stainless steel spelter sockets. Generally stainless steel cables are selected in applications where the cable system is highly visible or as an architectural feature for example transparent facades, glass curtain wall facades, exhibitions and convention centre halls, pavilions, footbridges and cable net roofs. Stainless steel cables can be supplied with a polished finish.

Stainless steel cables are available as Full Locked Coil (type FLX) or Open Spiral Strand (type OSX).

FLX ropes are manufactured using outer layers interlocking Z-shaped stainless steel wires around a core of stainless steel round wires. OSX strands are manufactured using layers of helically wound stainless steel round wires around a central core. The standard stainless steel grade used to produce OSX and FLX is 1.4401 (AISI 316). Each wire has a minimum tensile strength of 1470 N/mm^2. Stainless steel cables do not need for an internal corrosion inhibitor compound. Therefore they are usually produced dry or with a light manufacturing oil. Each individual stainless steel is tested and verified for physical properties including tensile strength, bending and ductility in accordance with EN 10264-4. Customised stainless steel casted sockets are also available to suit customer project specific requirements and specifications.

CABLE INSTALLATION AND TENSIONING, INSPECTION AND MAINTENANCE SERVICES, SPECIAL CUSTOMISED PRODUCTS

CABLE INSTALLATION AND TENSIONING, INSPECTION AND MAINTENANCE SERVICES

Based on decades of experience in the field of structural cable engineering, Teufelberger-Redaelli's scope extends beyond design, manufacture, supply and delivery of cable systems. It is essential that cable installation and tensioning are carried out in a safe, secure and well planned manner.

Teufelberger-Redaelli has a specialist team of site technicians supported by construction engineering expertise and an extensive fleet of industry leading installation and tensioning equipment. Whether in a new build environment or in a renovation and replacement of an existing structure our dedicated site engineering team are available to discuss the challenges of your project. They can offer standard and customised installation and tensioning solutions to suit your site conditions and constraints.

Once a structure has been built and the cables begin their service life it is vitally important that the cable system is regularly inspected and maintained. The inspection and maintenance cycle takes into consideration a number of factors including the required design load cycles and environmental impacts. Teufelberger-Redaelli Site Technicians are available 365 days per year to help inspect and maintain your cable system which is usually a critical part of the overall structure.

CABLE INSTALLATION AND TENSIONING

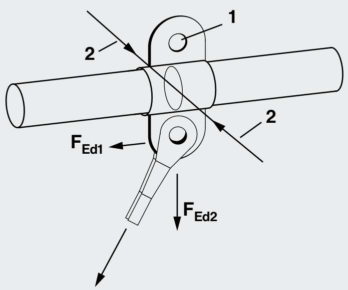
Correct assembly, installation and tensioning of cable assemblies on site is essential to ensure cables are installed safely, on time, within budget and to specification. Teufelberger-Redaelli aims to engage at the earliest possible stage of the project design process to ensure all that options and all constraints have been considered. With a wealth of experience there are often several different installation and tensioning options that can be studied and ultimately employed. Engagement with Teufelberger-Redaelli's site engineering team during design phase means a collaborative approach taken with the design team and the construction teams to ensure the fulfilment of client's project and prevent costly mistakes and remedial works.

Specific specialist areas of expertise provided by Teufelberger-Redaelli include:

- Design support to the cable system.
- Installation options including lay out of components on site and pre-assembly plans.
- Pre-assembly of cable assemblies and any connections, including clamps and spacers.
- Specifying, planning and mobilisation of cable tensioning equipment.
- Assistance with scheduling of site activities relating to cable installation.
- Assistance with tensioning sequence and tensioning stage options.
- Tensioning of cable assemblies, individually, in pairs, groups or complex synchronised lift programmes.
- Final cable forces check with a final tensioning report.
- Assistance with applying ancillary cable items, e.g. including application of Teufelberger-Redaelli Tensocoat cable corrosion protection to the cable surfaces and other approved paint systems.
- Assistance with de-mobilising labour, equipment and packaging.
- Planning, mobilising end executing de-tensioning of cable assemblies and cable nets from existing structures.

TEUFELBERGER-REDAELLI CABLE CLAMPS

Teufelberger-Redaelli regularly assists with the design, manufacture and installation of multiple cable clamp options to suit the structure's application. Cable clamp design are prepared and executed in accordance with International Standards including EN 1993-1-11, EN 1993-1-1 and EN 1993-1-8.



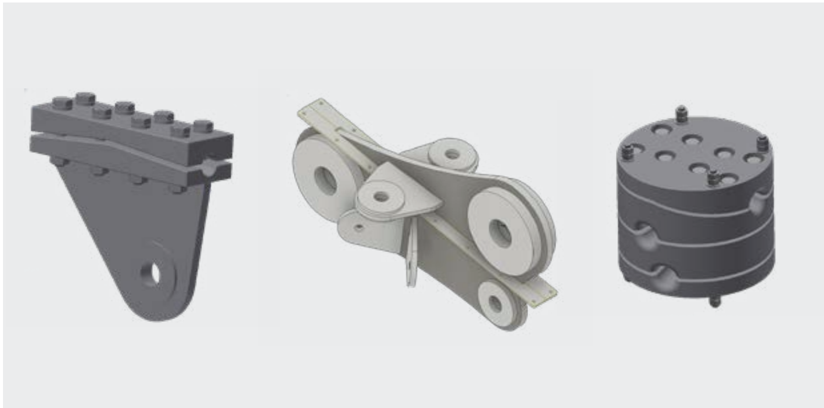
1 - Hole for preload bolts
2 - Preload F_r from preloaded bolts

$$FED \parallel \leq \frac{(FED \perp + Fr)\mu}{\gamma M, fr}$$

Where

FED‖ =	component of external design load parallel to the cable
FED⊥ =	component of the external design load perpendicular to the cable
Fr =	radial clamping force considered that may be reduced by items in 0(3)
μ =	coefficient of friction
γM, fr =	partial friction factor

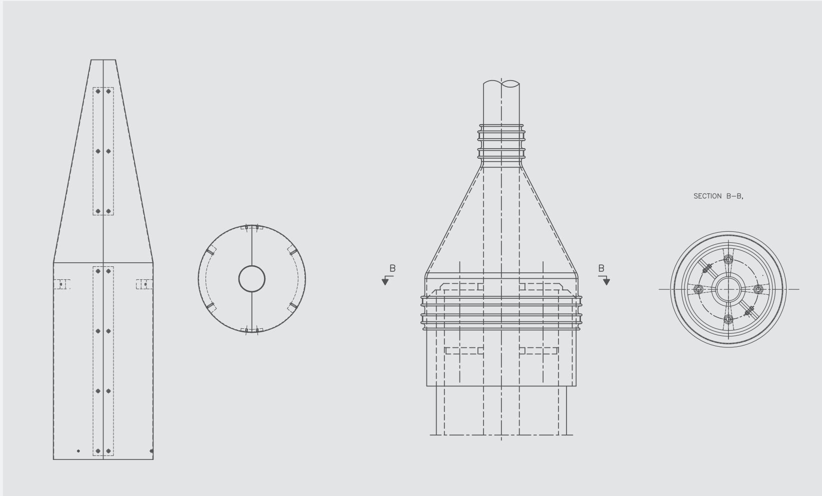
Depending on the application, clamps are either machined from solid steel sections or manufactured as customised cast steel pieces. Every clamp has its own unique friction coefficient value depending on the design and application of the structure. Thanks to Teufelberger-Redaelli's detailed knowledge and historical test data, an appropriate value of friction is selected for each specific clamp application. Spacer clamps can also be designed to fit cable intersections with different inclination angles between the cable axis, to suit each specific structure's design.



Particular attention is given to ensure all clamp types are designed to an optimum and adequate geometrical shape including rounded edges and with a specific bolt tensioning procedure. NDT tests can be performed on request.

ANCILLARY CABLE ITEMS

Teufelberger-Redaelli design and manufacture cable related ancillary fittings according to project specific requirements. These components include anti-vandalism devices, which can be installed around the cables adjacent to the lower socket anchorage to help prevent intentional damage and neoprene weather hood sleeves which protect cable lower anchorages from drench water ingress. Each customised solution is designed for the specific application in cooperation with the client to ensure the correct solution for the final application.



CABLE VIBRATION INFORMATION

A relatively small cross section area, a light mass and the lack of bending stiffness are characteristic properties of cables used in tensile structure applications. The result is these structural elements can be sensitive to vibrations depending on the in-service load case and natural harmonic frequencies of the overall structure. Whilst there are a range of cables vibration mechanisms, the two most common can be broadly grouped into those generated by wind and those related to the loading of the structure. Several countermeasures can be adopted to prevent excessive wind induced cable vibrations.

In general terms longer cables are more susceptible to vibrations, due to their larger wind exposure and lower damping values. Reference is made to EN 1993-1-11 for wind effects to be considered in design of structures with tension components.

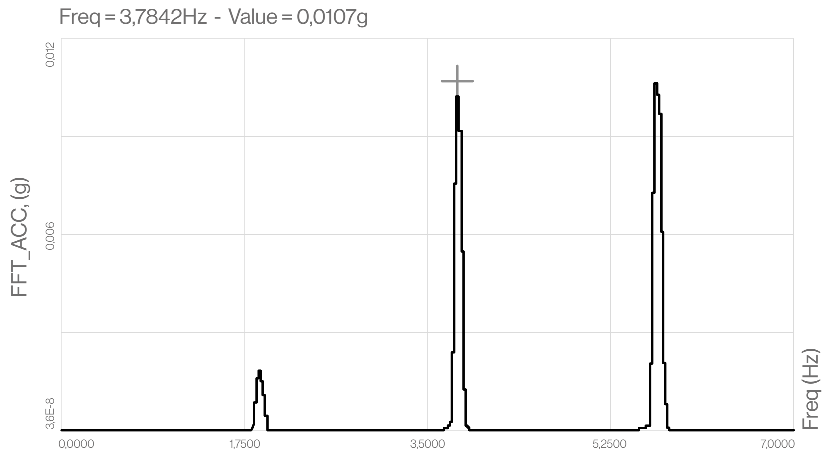
HIGH FREQUENCY AND LOW FREQUENCY DAMPERS

Teufelberger-Redaelli designed dampers can be applied on individual cables to increase the structural damping and help suppress excessive wind-induced vibrations. The cable system can be tested in a wind tunnel to investigate the risk of aerodynamic instability and determine the key parameters needed to design the damping system. An appropriate combination of high and low frequency damper can generally guarantee an effective control of vortex-induced vibration, which are one of the more common occurring oscillations and which represent a serious risk for the cable's long-term fatigue resistance.

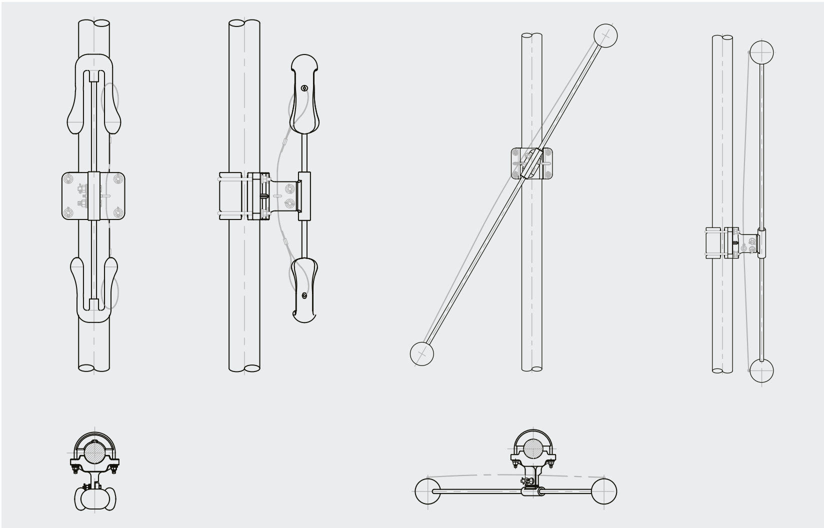
CABLES TENSION MEASUREMENTS WITH ACCELEROMETERS

In certain circumstances, cable natural vibration frequencies can also conveniently be used to measure cables forces by means of accelerometers. This system is efficient and adaptable and it minimises the time required to perform a lengthy and costly cable force survey.

The method allows for an estimation of cable force based on the signal record by attaching an accelerometer on the cable and the frequencies of cable excitation are measured accordingly. The system is rapid and does not require any mounting and de-mounting of unwieldy tensioning equipment.



Cable axial loads are estimated considering the simply supported beam model subjected to an axial tension. Using the corresponding analytical formulation, the key parameters to determine the tension from the natural frequency are the effective vibration length, the cable mass and the cable bending stiffness. Please note however it is not possible to employ this method if there are cable clamps intersecting along the length of the cable.



SERVICES

INSPECTION AND MAINTENANCE SERVICES

Regular, carefully planned maintenance activities are essential to protect the long-term health of cable supported structures. Planning and executing these cable maintenance activities is an important core part of Teufelberger-Redaelli's after service offering. Depending on the type of the structures, the environmental conditions and site access, a cable maintenance plan can be prepared which can provide a detailed overview of the different life stages of the structure and the related recommended courses of action and support services. Depending on each service life stage, different types of control and activities are required which include:

- Basic visual observation, to ensure the consistent geometry and cable forces are present in all elements of the cable assembly e.g. cables, sockets and any ancillary items.
- Visual inspection, to verify the status of the cable corrosion protection system without interrupting the normal operations of the structure.
- Simple inspection, to assess the surface and external wires condition and the status of the corrosion protection. It will include measuring the thickness of the protection layers of the cable systems and checking the socket cone setting. It may also include dismantling, removing and replacing the cable corrosion protection systems and may require, special access to each of the cable components that are to be inspected.
- Main inspection, comprehensive activities usually carried out in addition to the visual and simple inspection activities. It will include extended instrument checks for cable force measurement to check the permanence of the prestressing condition, cable re-tensioning in order to guarantee the efficiency of the structure, a geometric topographic survey, dismantling or removal and replacement of corrosion protections or cable components, special access to each of the cable components of the structural cable system.

Other inspection and maintenance activities can be defined specifically for each project.
